>appreciated.

Yes, there is a common failure mode: the power supply regulator -- or at least the transistors (regulators?) at the back of the drive tended to develop poor conductivity to the rest of the system. I think it was a small paddle board with either an edge connector or a ribbon cable (obviously, it's been a long time since I used one). I was always cleaning the connections (what else should a programmer do?).

I have some Software imported from USA and have no Problem
to use it on my PAL Atari 800 in Germany.

There is, I think so, only a difference between the power
supplies: USA 110 V, Europe 220 V AC/DC.

ciao
Robin

Hi Piero!

p.cavina@mo.nettuno.it (Piero Cavina) writes:

>I didn't find an answer for this in the Atari 8-bit FAQ...

>Is the software for the Atari 8-bit computers "tv-standard dependent"
>(this means that different versions of the same program, NTSC and PAL,
>must be written) - like it happens the Atari 2600 game console?

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

Greetings,
Thomas

Could you point us to where we can get a copy of the 'hack'?

I've a French 800XL which I can't easily use in the US (where I'm
living now) because of the video.

>(it takes too long for the buffer to empty out)

Not quite sure if it's the same issue, but I have much better luck with Atar-Z-Modem when I'm writing locally to RAMdisk, rather than to floppy. My logic is similar; the host zmodem program doesn't seem patient enough to wait for the Atari to copy its download buffer to floppy, and the transfer bombs. But the problem goes away if I download to RAMdisk instead.

Looks like Bill took away the 8bit Index file at some point.

The mirror of the UMich archive at:

ftp://ftp.toad.net/pub/umich/8bit/

is still there and looks up to date.

Even on the home site, at http://www.umich.edu/~archive/atari/8bit/ there doesn't seem to be an 8-bit
index file anymore.

You might point out that you miss the index file to Bill Kendrick at mailto:kendrick@zippy.sonoma.edu

What I received from FTe is SDX 4.22, which does say "FTe" in the VER
information, along with a revision date of (I believe) 10-15-95?? I'd have
to check on the date again.

>My question is, did I get the "FTe" upgrade? If so, what are the
>enhancements?

My original ROM purchased from ICD was SDX 4.20. I believe 4.21 ROMs are
around also, is that what you got perhaps?

To be honest, I can't even remember what was new in 4.22 right now, without
looking into it again..

That TI modulator will not work on that system. It draws +5v off of the
TI monitor port which it needs to operate. The Atari port does not have
+5v coming off of the monitor port.

The 800XL does have built-in RF and, as such, only needs a simple switch
box purchased either from Radio Shack (if they even carry them any more)
or your local thrift store.

>
> I need a power supply for this 800 XL,to see if it works.

Hmmm, a number of vendors have them for sale. I do have some extras which
I would sell rather inexpensively.

There are a number of floppy drives avaialable for the 8-bit series of
computers. However, to do what you want to do would require a goodly
amount of money. Your best best iss to find a serial port interface
(again various models are available) and doing a null modem transfer.

Hope this helps.

Cross-posted to: alt.games.video.classic,comp.forsale.computers,comp.sys.amiga,comp.sys.amiga.marketplace,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.cbm,comp.sys.computers.marketplace,comp.sys.tandy,comp.sys.ti,rec.games.video.classic,rec.games.video.market

I did a posting earlier in a few newsgroups and have already had some good response so I decided I would post my complete inventory that I would like to get rid of, sorry for the length of the message and cross posting.

I have the following Computer components and cartridges for sale. If you are interested in something, please make me an offer in U.S. Funds (buyer pays shipping). All the equipment is in working condition, but without boxes unless noted.

Coleco Adam
==========

Hardware
-Adam add on for Colecovision

Adam Data Packs
AdamLink
Black data Pack
Buck Rogers-Planet of Zoom
Letters & Forms-With box and Manuals
SmartBasic
SmartLogo-With box and Manuals

Commodore
==========

Hardware
-Commodore 64 Computer-With original box and Power Supply
-Commodore 64 Computer-With Original Power Supply, missing Run/Stop key.

Cartridges
-Clowns
-Jungle Hunt
-Kickman
-Lazarian
-Number Nabber Shape Grabber
-Omega Race
-Radar Rat Race
-Sea Wolf
-Serpentine
-Tooth Invaders

Amiga Hardware
-Custom made 15 foot Amiga RGB/Audio to SONY XBR/XBR II Monitor/Audio cable

Controllers
-Please see the controller section near the end of this post

Magazines
-Please see the Assorted Magazine section near the end of this post

Atari
==========

Hardware
-Atari 800XL With Power Supply, RF Cable
-Atari 600XL With Power Supply, RF Cable
-Atari 1200XL With Power Supply, RF Cable
-Atari 130XE With Power Supply
-Atari 1050 Disk Drive With Power Supply and connection cable
-Atari 1050 Disk Drive Without Power Supply
-Atari XF551 Disk Drive With Power Supply and connection cable
-Indus GT Disk Drive Without Power Supply and connection cable
-Atari XMM801 Printer With manual, Power Supply and Atari Writer Plus
-Atari 520 ST Missing all accesories
-Custom made Atari RGB to SONY XBR/XBR II Monitor Cable
-Custom made Atari Composite Video/Audio cable (standard RCA jacks)

Controllers
-Please see the controller section near the end of this post

Cartridges
Atari Writer
Basic
Centipede
Defender
Donkey Kong
Donkey Kong Junior
Eastern Front (1941)
Final Legacy
Frogger
Miner 2049er
Missle Command
Ms. Pacman
Pac-Man
Pole Position
Qbert
Realsports Football
Robotron: 2084
Star Raiders
Tennis

Books and Manuals
-Atari 800XL Manual and conection guide
-Atari 1050 Manual
-Consumer's Guide "The Users Guide to the Atari"
-Compute's "Third book of Atari"
-Compute's "The Atari Basic Source Book"

Magazines and Specification sheets
-1986 Atari ST Computer Brochure
-ST-Log Issue 10 Jan 1987
-Antic Volume 4, number 10 Feb 1986
-Start-The ST Quarterly Summer 1996 Premier Issue

Texas Instruments
==========

Hardware
-TI 99 4/A Complete with power adapter, RF adapter, plastic computer cover, all manuals and reference cards.
-TI 99 4/A Complete with power adapter, RF adapter and BASIC reference card.
-Dual cassette connector cable

Texas Instruments Cartridges

Boxed with manuals

-2x Suncom Tac Joysticks-for Atari & Commodore units
-4x Wico Command Control Joystick-for Atari & Commodore units
-2x Wico Joystick (Black handle with grey base)-for Atari & Commodore units
-1x Spectravideo Joystick with suction cup base-for Atari & Commodore units

Assorted Magazines
==========

-Family Computing Volume 3, number 11 Nov 1985
-Popular Computing Jan 1985 featuring the Tandy 1000
-Popular Computing Dec 1983 Featuring "the new 1984 Computers"
-Computers & Programs Feb.1984 Premiere Issue
-Compute Issue 74 July 1986
-Compute Issue 73 June 1986

Trades
==========
I may consider trades in the following areas, however sales at this point are more appealing to me and will take priority. As far as trades go, I am interested in the following categories...

Intellivision Rare Hardware and cartridges as well as Shrinkwrapped cartridges
Sears Tele-Games Shrinkwrapped Tele-Games (Intellivision) cartridges
Vectrex Hardware, Controllers and cartridges
Atari Lynx Hardware and cartridges
Atari Portfolio Hardware and accessories
Mattel Electronics Handhelds (especially Backgammon and Spead Freak), Aquarius computer items, etc.
Coleco Handhelds and tabletops, Total Control 4 carts as well as some ColecoVision items
Microvision Hardware and cartridges

I belive the US govermet gave them the ok to pack the internet with
Porno...
I hate it and I still cant figure what a ....porno pic has to do with
free speach?

Porno pictures uses EYES as sensors

Freedom of speach is deliverd by MOUTH not EYES

And why post that crap on the Atari 8bit .....SIG?
I think we should REPORT all Kiddie Porno to the State Police

Feedback Welcomed

I would love to hook up all my 8bits to an LCD display B&W or Color
I have been thinking of such a mod for the last 7 years, The problem is
and Im sure you already know that there is no standerd LCD display.
All Laptops LCD where developed for the machine its on.... Sick huh?

I belive VGA would be a bit to sharp, ever see the Xformer?
Thats a bit tooo sharp!
For me anyways.

Color TTL sounds good, has anyone here in this SIG did Bob's Mod from
Atari Classics?

34. for sale: Atari items

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-02 00:00:00 UTC
From: bx557@torfree.net
Message-ID: <ECoDxC.Ir3.0.bloor@torfree.net>

I have the following items for sale:

Atari 1025 printer, with manual. 7-pin dot matrix, connects directly
to SIO port. Uses standard typewriter ribbon. NOTE: this thing
weighs a ton, so shipping may be a bit high. $10

Atari 1050 drive, NON-WORKING, for parts only. No power supply. $5

Rana 1000 drive, double-density, track display, write protect, can
format disks without being connected to a computer. Does not include
power supply but it can use a 1050 power supply. $15

Okidata Microline 182 printer, 9-pin dot-matrix. $10

Hayes Smartmodem 1200 with power supply, NOT TESTED $5

Multitech 1200 bps modem with power supply. NOT TESTED $5

Winner joypad, Nintendo style controller, originally for
IBM-PC. I rewired it to work with Atari 8-bit. It works
with any game which uses a joystick. Also works on 2600.
This is the best joystick I've ever used with my Atari. $8

Video Touch Pad $3

Software: all include box and manual unless otherwise noted.

Silent Service $4

Music Construction Set $4

Verb Viper, disk only, $2

Math Blaster, 2 disks only, $3

Choplifer, disk only,, $3

Mind Mazes, disk only, $2

Analog Disk #79 June 1989, $2

Print Shop Companion $7

Bank Street Writer, disk only, $3

Atari Silent Butler, 2 disks only, $3

Partyware, 2 disks, $3

Atari Timewise, manual, no box, $3

Print Shop, disk only, $3

Print Shop Graphics Lib. #1, disk only $3

Books/Manuals:

1050/DOS 3, $3
Introduction to Disk Op. System. (DOS 2.0) $3
1050/DOS 2 Reference Manual (DOS 2.0s/2.0d) $4
1050 Owner's Guide $3
1200xl Owner's Guide $3
Compute's 1st Book of Atari. $5
Compute's 2nd book of Atari. $5

Prices do not include shipping. I think my prices are fair but if you disagree please make an offer. Items will be shipped within 24 hours of receiving payment. I am in Dayton, Ohio, not Canada.

35. FS Atari Stuff

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-02 00:00:00 UTC
From: cdhoste@aol.com
Message-ID: <19970702064301.CAA25545@ladder02.news.aol.com>
Source record: 72105

Atari items for sale. I'll pay one half the shipping and handling costs
but NOT the C.O.D. charge. If you don't believe the prices are fair I am
willing to listen to your offer. Enjoy!

1) Flight Simulator II --subLogic flight simulator. Original box and
manuals. Including the
navigation maps. Price $15

2) AtariWriter and Atari Proofreader --the classic word processor and a
dictionary program.
Original manual including the quick reference sheet for the AtariWriter
but no documentation for
the Proofreader and no box. Price $25

3) Movie Maker --an animation construction set by Electronic Arts.
Original manual and box.
Price $10

4) 5"1/4" Disk Organizer with disks! --a grab bag of software everything
from Antic Magazine
disks to games like Mail Order Monster and Summer Games both classic 80's
computer games.
Price $25

5) Atari 1010 Cassette drive --not sure if it works but power supply and
light seem to work. Also
included is the data cable and a conversational French program. Has sound
and original box and
manual. If anything this is the first multimedia device for the Atari!
Price $10

6)Atari 1027 Daisy Wheel printer --not sure if it works but power supply
and light seem to work.
Also included is the data cable. Price $10

36. HELP: Stupid 1050 question...

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-02 00:00:00 UTC
From: "Eric R. Balch" <erbalch@adnc.com>
Message-ID: <01bc877a$00cb13c0$140d9ecf@quasar>
Source record: 72106

O.K. I know that this is a kinda stupid question but here goes anyway:

I just got a 1200XL and a coupla 1050 drives (to replace the system I loved so dearly and was stolen many moons ago). Now, the problem is when I had my last 1200 I could only afford one 1050 so I have never used an Atari 8-bit system with multiple floppy drives...

So, the stupid question:
How do I set the switches (what positions do I use) on the back of the 1050s so BOTH drives will be accessable? I tried a few different combinations but to no avail. Is there some special Voodoo incantation I need to do or somthing? I would RTFM but I have no FM2R! I know I have the cabels hooked up right =;-) Also, I know that BOTH drives do work. I just can't seem to get one to work as drive 1 and the other to work as drive 2.

Many thanks in advance for any help!

Eric

37. FS: HARD TO FIND COMPUTER BOOKS

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-02 00:00:00 UTC
From: dastar@crl.com
Message-ID: <5pd2csntm1@nnrp1.crl.com>
Source record: 72107

Collector's Book Sale!

I've decided to share a recent used bookstore find with other collectors
of vintage computer stuff.

These are all books published by Franklin Watts in a series called "Computer
Literacy Skills". All the books in the series were written by Christoper
Lampton. They are hard bound with paper covers. The books themselves are
in mint condition, but the covers range from mint to very good (some tears,
wrinkles, creases). They are all copyrighted in 1984/1985. The books in the
best condition will be sold on a first-come, first-served basis. These are
really nice books, and I am keeping a set for myself.

The titles are:

Graphics and Animation on the TRS-80 Models I, III and 4

Graphics and Animation on the Atari 800, 400, 1200XL, 800XL, and 600XL

Graphics and Animation on the Commodore 64

Z80 Assembly-Language Programming for Radio Shack, Timex Sinclair, Adam,
and CP/M Computers

PILOT for Beginners

FORTH for Beginners

I have a total of 24 of these books in different assortments. I am selling
each book for $5.00 each.

All books will be shipped in a protective cardboard container to preserve
their superb condition. Shipping charges are bourne by the buyer.

If interested, please send e-mail to dastar@crl.com for more information
on ordering and shipping charges. Shipping is from California, 94588.
Checks or money orders accepted.

Eric,
Easy, D1: the switches should be set both to the left.
D2: the switches should be set white left black right
D3: the switches should be set both right
D4: the switches should be set white right black left

This is just a binary value of 00, 01, 10 and 11.

Does anybody know if this modification is available online? I have a PAL 600XL which produces a horrible picture on my C=1702 (with composite input). I would like to use the chroma/luma input.

Nicolas

Greetings Folks,
I am currently the high bidder at $31.00 for an Atari 800 system.
Something has come up and I was wondering if someone who is interested in
an Atari 800 system could bid $32.00 and take me off being high bidder. I'm
prepared to win this auction, but if someone out there is interested in
purchasing an Atari 800 system with 2 cartridges, get more info at this
URL:

dunno, but I know that some pal demos won't run on NTSC computers. The
game Ultima III won't have colors on pal screens.

but the programs should work, pal or ntsc...

Lost a complete hard drive in the PC that I thought I had backed up but
didn't. So I have lost the files that had bids on the cartridges, and
orders from different individuals on hardware.

If you didn't get a response from me please resend the mail and I will
get the information out asap.

Sorry for the inconvenience..

On the back on the 1050 drive you should see in one of the corner, two
little switches (on drive 1, they are both on top of each other) I think
you need to move the top one over)

At any rate, read the Atari dos 2.5 manual i sold to you. I know it is
for the xf551 drive but changing drive number is the same idea. It is
bascically trial and error. Also, the dos you are suing must be
configured to handle 2 drives (most dos' are, but sometimes people
configure a dos to use only one disk drive, save a whole 100 bytes of RAM
of so... I can't remember if the dos 2.5 disk I sold you was altered or
not. I think it has the original 2 drive setup.

I have an Atari 800 for sale, fully functional, with 48k RAM and Atari Basic cartridge. Also will include the power supply, as well as two floppy drives. The floppy drives are as follows:

IndusGT: powers up, but gives an error.
Atari 1050: no power, nothing.

No manuals for the system, or the floppies will be included. The only power supply included will be for the Atari 800. Asking $20 + shipping. If interested, respond by Email. Thanks.

57. Atari Computers For Sale!

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-03 00:00:00 UTC
From: bensmith@linda.teleport.com
Message-ID: <5pi0fl$h9h$1@linda.teleport.com>
Source record: 72034
Cross-posted to: pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

I've Added more stock to my Atari catalogs. So check it out.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

```
Welcome to Classic Collector's Super
Auction!!
** Items added in Atari 8-bit and
SMS**
Rules are simple:
1. Increasments are:
$1.00-$4.00 = $1.00
$5.00-$9.00 = $2.00
$10.00-$14.00 = $4.00
$15.00-+ = $5.00
2. Shipping is $1.00 in Canada, $2.00 in USA for 1 CART (not system).

Included in this auction are: NES, Sega Master System, Atari 8-bit, Atari
2600, SNES, Genesis, Game Boy and Misc.

E-Mail bid to: cbel@istar.ca

ON TO THE AUCTION!!!!!

Sega Master System:

Min bid per cart is $3.00

Thunder Blade, loose
Wonder Boy, loose
Choplifter, loose
California Games, loose

Min bid per card is $3.00

**NEW!**Super Tennis, boxed with plastic casing
**NEW!**F-16 Fighter, boxed w/instuctions

Sega Master System with power supply, RF connector and cable, 2
controllers, built in Safari Hunt/Hang On, works great. Min bid $20.00

SNES:

Mortal Kombat, loose
Min Bid is $5.00

Sega Genesis:

Min bid per cart is $5.00

Sonic, boxed
Sonic Spinball, boxed, manual
```

Taz, boxed
Alladin, boxed $5.00 Steve Riffel
Ecco the Dolphin, boxed

NES:

Bases Loaded, loose.
Min bid is $5.00

Atari 8-bit:

2 Atari 1050 disk drives Min Bid is $10.00 ea.
Atari 1010 tape drive, Min bid: $10.00
Atari Tapes, Min $1.00:
Spider Invasion
Bruce Lee
Owari
Bug Off!
Thorn Emi Compute 4
Guardians of the gorn
Pokersam
Avalanche
Swamp Chomp
Crypts of terror
Zepplin
Spitfire Ace
Intruder
Canyon Climber
NEW! Donkey Kong cart, loose. Min bid is $5.00

Atari 130XE system, power supply, two joysticks, no games (basic built in),
RF connector and cable.
$20.00 dpatekar

Atari 400 system, same as above but with Donkey Kong cart.
Min bid is $15.00

Atari 2600:

Min Bid is $1.00 per cart.

Donkey Kong
Donkey Kong
Combat
Defender
Defender
Astroblast
Missile Command
Warloards
Space Invaders
Dodge 'em
E.T. $1.00 Suzy
Pac-man $1.00 Suzy

Pac-man
Asteroids
Star Wars: The Emporer Strikes Back

Misc:

Coleco Telestar Marksman: Bunch of built in pong games. $10.00 sumguy

I will also vouch for the Commodore 1084 as one of the top monitors for
use with the Atari 8-bits, especially in separated video mode.

Tom

Euskara (euskara@aol.com) wrote:
: Without a doubt the best monitor you can buy for your 8 bit is an Amiga
: monitor (also made by commodore). I have a 1084 and the picture is
: unbelievable. I have had a magnavox, 1902 and used an S-input TV. The
: Amiga left them all in the dirt. I found mine by posting a message in the
: Amiga newsgroup. Just my 2 cents' worth.

dklugh@iwaynet.net wrote:

>"Console games"?
>As opposed to what,board games???
>(board=bored!)
As in computer systems that are specialized for playing games and perform few or no other functions. Since they lack devices for ready access such as keyboards and programs for development such as assemblers and compilers, they are effectively closed to most of us. I am aware that consoles have development systems that games are programmed on but these always cost big bucks and bureuacratic hassles to obtain. This means playing by the console marketers' rules.

>Actually DOOM 64 is quite bloody.But the lack of multi-player options make it
>rather useless.Perhaps the 64DD will change that.
>(thus I prefer the Genesis' "Battle Frenzy" to DOOM 64)
Perhaps so but the "Disney" remark pretty much holds for the original Nintendo. Besides what does Doom64 cost to buy. Most of these games START around $60.00. Quality recent PC games can often be had for under $40.00. Why. Competition. How does competition come about? Yep, you guessed it: open system.

>
> >for Macs and PCs. Does this make people reluctant to play games on
> >PCs? Not really.
>
>Well remember that people buy the PC and then just soak up all that FREE
>software!
True but I paid for my copies of Descent and Doom and many other games besides. ID software doesn't exactly look broke to me.

>
> >The 7800 was the last console Atari had. A glut of "crappy third
>
>uh,wasn't the Jaguar and/or the TT the last console?
Yep, should have said "last 8-bit console". Properly marketed it could have had some decent market share. BS name recognition would still have sold more Nintendos but Jack Tramiel let it get SLAUGHTERED, just like every other product of the Tramiel Atari.

> >7800. Atari used an encryption algorithm in the 7800 operating

Result same. Little or no third party development leading to a lack of
reasonably priced and abundant titles.

Little out of date aren't we? Protected mode has been around since the
286. Support for over 1Mb has certainly been common since the first
386 machines. The EGA has likewise been around since the mid eighties
and VGA since '87 and SuperVGA not long after. If I wanted to make an
equally meaningless complaint, I would point out that the Mac had no
color, only monochrome. As far as serious work goes, I know of
surveying businesses that used 286 and plotters to develop plats. If
that isn't "serious work" what is?

>
> >(Please spare me long florid descriptions of how good the Mac is,

impossible to buy
>them!
Perhaps so, but if the Mac used industry standard expansion buses and standard serial and parallel ports from the beginning it would have done better. If the OS was cloned, it would have given PCs serious trouble. As it is, wounded Mac aficinados aside, the PC is the clear winner in the marketplace. Was it the elegant interface? Yeah sure. Heh. Heh. Was it the ease of configuration? NOT The consistent operating system conventions? Hell no. Know what made it the champ? That's right. You guessed right. The secret word for tonight is "Open System."

>(you'll notice that many early PC games used text mode to get around
the meager
> capabilities of the (SLOW!) graphics mode.And the CGA text mode is
slow as
> well)
No doubt. I preferred to play games on my 800XL or the C64s at friend's houses. Mac games were nicely high res and some had digitized sound but they were monochrome. Not very fun to look at sometimes.

62. Taquart problems

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-03 00:00:00 UTC
From: guy1015@aol.com
Message-ID: <19970703054501.BAA04258@ladder02.news.aol.com>
Source record: 72122

I have been having problems on Taquart site in Poland the last few weeks
with
file transfer, Somebody please inform them, also all there Md8 files
on there
other webpage is corrupted.

63. How to tune the sound volume in XL-IT?

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-03 00:00:00 UTC
From: Martin.Koppmann@stud.uni-regensburg.de
Message-ID: <Martin.Koppmann.1.000A18B1@stud.uni-regensburg.de>
Source record: 72123

I have got a Soundblaster 32PnP, which is only able to set the Sound volume by
software, but have not found an option in XL-IT 0.20 yet.
Therefore the Sound is maximum loud.
XL-It requires the SET BLASTER=A220 I5 D1 environment variable.
There also exist the shareware sbvol.exe which is a TRS-Program and allows to
set the volume, but this doesn't work with XL-IT.
Can anybody help me?

ciao
Martin

64. PSU rating for Atari 800 model?

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-03 00:00:00 UTC
From: karolus@kuerbis.cs.tu-berlin.de
Message-ID: <KAROLUS.97Jul3151513@kuerbis.cs.tu-berlin.de>
Source record: 72124

Just got a 800 model (no XL/XE) without PSU.
Which voltage does it need, and which is the polarity of the plug?
Thanks in advance,
Achim

From: buesch@srv.net
Message-ID: <m267ur8btm.fsf@caligula.srv.net>
Source record: 72042

peter@soemtron.sb.sub.de (Thomas Havemeister) writes:

> > Is the software for the Atari 8-bit computers "tv-standard dependent"
> > (this means that different versions of the same program, NTSC and PAL,
> > must be written) - like it happens the Atari 2600 game console?

Not absolutely. Specifically, most software runs fine on both
standards.

> dunno, but I know that some pal demos won't run on NTSC computers.

This is because PAL machines have a vertical refresh frequency of 50hz
(NTSC use 60hz) which translates into more vertical blanking time for
demos and other computation-intensive graphics software. So PAL demos
that won't work on NTSC machines are usually returning from a VBI
(vertical blanking interrupt) too late. Some also attempt to use more
vertical resolution ("longer" display lists) than an NTSC display can
handle.

> The
> game Ultima III won't have colors on pal screens.

That's interesting. I assume this is an artifacting issue? What
about David's Midnight Magic, Pinball Construction Set, Bug Hunt,
Flight Simulator II, the original Lode Runner, and other software that
uses artifacting? Sounds reasonable, but I never knew artifacting
didn't work between PAL and NTSC.

> but the programs should work, pal or ntsc...

Some demos crash outright on ntsc machines. Also, it is possible to
tell from the roms whether you're running on a PAL or NTSC machine,
and some software will stop outright and tell you it won't run on an
NTSC machine.

Brent

I'm not sure if your symptoms were the same as mine, but my big mistake was that I had somehow got the 1489 chip in -backwards-, with the result that there appeared to be major video distortion on my Atari. After fixing that, I found that I had made a second mistake by swapping the TxD and RxD lines on the PC end (by using the 25-pin settings instead of the 9-pin), but this didn't seem to hurt either computer.

74. Fair in Hanau/Germany by Ke-Soft

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-04 00:00:00 UTC
From: schallt@worms.fh-rpl.de
Message-ID: <5piuic$fu0$1@widukind.fh-worms.de>
Source record: 72044

Hi Atari 8 bit user,

Here is now the review about the 97 Ke-Soft fair in Hanau/Germany:

The fair was held in Hanau/Germany a little city near Frankfurt.

My friend and I arrvied at 9 p.m on a sunday in Hanau. The fair was held in a pub near a sport gym.

It took one hour to place our Hard- & Software for the XL/E and others.

We met there Kaisersoft (Top Mag, Ram) , Thomas Grassel and Harry Reminder (Sio2PC , Raf), Thimo Graef (Atari Classic) , KE-Soft (old/new Hard- & Software for Xl/E and VCS), Andreas Magenheimer (copyright of the Brundles, Writer of XL/E related info, Ram) , Tobias Hang (Slope Memory , Ram) and me (XL Hardware developer (easy things) , Ram) and AMC..

At 10 o clock should be open for public but it took 2 hours before the first people came.

I think there have been about ... hm yes 12 users that came to the fair. So it was a great "suckess".

Ok, I think it was the last time i was on that fair. The fair started years ago with more than 80 people and had fall down to 12 people.

Because you don`t want to read such boring things ...
I tell you what you could see and by.

*Ke-Soft had:

VCS 2600/7800 oldies and Hardware for example Joust, River Raid and so on.

The XL/E Cards where:
Tower Toppler (Nebolus Clone), Defelector (guide a beam into a target) , Xenomorph (Kill em all), Monster Maze (Midi Maze clone could be up to 4 players), Comando (shoot em up), Stargate (defender clone).

The different Disk have been:
Video Title shop, Newsroom, Print shop, Orge, Great Am. C C R , Lord of conquest and many more.

Ke-Soft had the greatest Stock (& Prices). IF you are intersted in his stock soft- and hardware E-Mail me or look at the ABBUC Homepage.

*Kaisersoft had the following Polensoft:
Sexy Six (Girls with less clothes), Data 1,2,3 , Midnight from Bewesoft, Master Head (a Sobokan clone), Eureka , Cyborg (a maze hunting game).
Most games from 94 & 95.

*Slope Memory had two new things:

StarLock 1 (pic`s and sound`s from the Star Treck series)
New StarLock 2 (later pic`s and sound`s with the new series)
New Cliparts (cliparts)

Hardware:
Port tester (you can now read out the ports)

*Thomas Grassel & Harry Reminder had hardware:

The new power unit for XL and 1050.
Sio2PC interface (transfere you disk images to PC and use the Pc as a slave of the XL/E).
New Xformer cable (for the PCXformer)

*AMC (Armis was back again):

Sterea Blaster Pro , Sound interfaces, Power pad, and some AMC Classic games.

*Andreas Magenheimer

Software and Hardware:

AT Bus interface for XL (2 IDE devices could be used)
XF 351 Floppy (XF551 with 720KB 3.25" Drive)
and some used software (at low prices) Lords of Conquest, Blastron and Boulder Dash Con. Kit.

Me:

I had many 1050, 2 used Jags, 1010 Data recorder, XC 12 , AT Bus Interface, and new and used Jag and XL games.

So if you intesrested in:

Polensoft Email me for AMC, Kaisersoft, KE-Soft

Viedeo game systems Timo Graef, Ke-Soft, me

XL classic`s AMC , Ke-Soft

XL all AMC , Kaisersoft, KE-Soft

Jag, Lynx, XL/E hardwaer me

Oh * stop wait *

This is not normal that a geramn fair has so less public interest. The fair in Herten (ABBUC = more than 540 Atari 8 Bit organised user) and the Schreiersgruen fair are great. between 70 and 100 Atari 8 Bit user on 1 day. Ok the fair is one day but this in germany great.

PS:
I hope you could understand what i mean but my english is worse :-(, please forgive me :-).

Z U at the ABBUC fair in Herten 97

King kong

it isn't a question of buying it.. all he needs is a copy of the roms
saved to pc/disk image. the emu for the mac runs just the same xl-it on
the pc. ohh hell you knew that of course.

76. $$$$ EASY AND LEGAL $$$$

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-04 00:00:00 UTC
From: a15@a.a
Message-ID: <33bcae73.0@news.genesisnetwork.net>
Source record: 72046

$50,000.00 for only $5.00 within 2 MONTHS?????
==========

You gotta be crazy! How on earth do you think you can buy 50 grand
for lousy 5 bucks? Well, that's what I was wondering, too until I
came across this letter.

First of all, IT'S PERFECTLY LEGAL! (Call 1-800-725-2161) if you
have any questions about the following opportunity to make
$50,000.00 and that probably WITHIN LESS THAN TWO MONTHS!

Well, here it goes:
A little while back, I was browsing these newsgroups, just like you
are now, and came across an article similar to this that said you
could make thousands of dollars within weeks with only an initial
investment of $5.00! So I thought, "Yeah, right, this must be a joke,"
but like most of us I was curious, so I kept reading. Anyway, it said
that you send $1.00 to each of the 5 names and address stated in the
article. You then place your own name and address in the bottom of the
list at #5, and post the article in at least 200 newsgroups. (There
are thousands) No catch, that was it.

I knew that that was the opportunity I had waited for for a long time.
I thought it was about time that the money of the world gets into the
right hands! OURS, right? I never had a doubt that this thing will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a try?

As I mentioned before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out with the U.S. Post Office (1-800-725-2161) and they confirmed
that it is indeed legal!

Now, that's how your story WILL sound like, too if you participate:

Well GUESS WHAT!!... with in 7 days, I started getting money in the
mail! I was shocked! I still figured it would end soon, and didn't
give it another thought. But the money just kept coming in. In my
first week, I made about $20.00 to $30.00 dollars. By the end of the
second week I had made a total of over $1,000.00!!!!!! In the third
week I had over $10,000.00 and it's still growing. This is now my
fourth week and I have made a total of just over $42,000.00 and it's
still coming in ....

Let me tell you how this works and most importantly, Why
it works....also, make sure you print a copy of this article NOW, so
you can get the information off of it as you need it. The process is

very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Jezil
114 Jefferson Ave.
Slidell, LA 70460

#2 Phil Walther Jr.
9495 Annapolis Lane North
Maple Grove, MN 55369

#3 C. E. Burkman
170 University Ave. W
Suite 12-129
Waterloo, Ontario
N2L 3E9

#4 A. Bailey
1207 Reeves Road
Plainfield, IN 46168

#5 J. Martin
P.O. Box 2292
Reston, Va. 20190

STEP 2: Now take the #1 name off the list that you see above, move the other names up (2 becomes 1, 3 becomes 2, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:
1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right , you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

This entire principle works because it is in a format of an upside down tree with thousands of branches. Everyone below you will see to it that the tree continues because they want to get money. Those below THEM will continue because THEY want to get the cash etc.

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM of 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00
at #4 $225.00
at #3 $3,375.00
at #2 $50,625.00
at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 and start posting again.
The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! And this will go on and on and on and on.... get the picture? Well, there's 5,000,000,000 people on the world and most of them will eventually end up being hooked into the internet. So there are virtually unlimited resources. Of course this will work the best at the very beginning so the faster you post, the better for YOU!

So can you afford $5.00 and see if it really works?? I think so! People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income. Thanks once again...

77. wanted: impressions/thoughts/comments

Newsgroup: comp.sys.atari.8bit

I'm putting together a collection of stories and first impression
experiences about early systems to be displayed on my future web page.

Also, the contents including..
some newsgroup postings
working emulators
technical documentation
other stories
other select web pages
photos
scanned press material
..is to be stored for the far future.

If you want to contribute here's something to consider:
What was the first computer you played with? Where is it now?
What was the first arcade you visited? What was your room like?
When, what season, what was the weather like at the time..Everything!
What was you favorite 8bit (atari-c64-whatever) game?
What was the name of the first computer stores you visited? Where?
How did that computer store smell? What kinda lighting?
Tell me about the sense of discovery. What did your parent's think about
your newfound toy? How did pay for software? Did you pirate it? Tell me
about the videogame sleepovers.
Ever skip school to finish that star raiders championship? .Everything!

Well whatever you care to remember and yak about :-)

Keith

>Speaking of best Atari 8-bit games ever, does anybody still play
>or remember the tank-war game Combat Leader??

Wargame ... ATARI?
There's another one! I'm not the only ATARI wargamer left!

Yes I still play David Hille's "Combat Leader" and "Battalion Commander" as well as "The Cosmic Balance" by Paul Murray, "Six-gun Shootout" by Jeff Johnson (ATARI programming by Keith Bors), and all of Roger Damon's games.

Beginning with "Operation Whirlwind", a landmark as it was the first game of its type published by Broderbund, Damon improved the scrolling map interface that Chris Crawford developed in "Eastern Front". Using only the joystick and function keys for all controls Damon's games have an ease of playability that has yet, in my opinion, to be exceeded on any platform. Of Damon's games, "Field of Fire", his second to be published (first by SSI) is my favorite wargame.

I also still play "Invasion Orion", "Nukewar", "B1 Nuclear Bomber", and "Eastern Front".

Are there any other ATARI wargamers here?

The ROMs are the same for PAL and NTSC computers. The OS can tell where he is by checking a hardware location on GTIA. You can drop a PAL ANTIC in an NTSC machine, tweak the OS into thinking it's PAL and run PAL s/w just fine on an NTSC monitor. In fact, almost all PAL s/w will run without the OS tweak....

Bob

>
>Just got a 800 model (no XL/XE) without PSU.
>Which voltage does it need, and which is the polarity of the plug?
>Thanks in advance,

It takes a 9 volt AC supply rated at 31va (about 3.5 amps) but an internal
fuse limits that to 2.5 amps. Being AC it is not polarized.

PRINT PEEK(43234)

(I think that is right location)
A value of 234 is Revision C (built into all XE models and some of the
NEWER XL machines)
I don't have the other numbers handy. I have the info somewhere in my
vast Antic and Compute magazine collection!

Alan

84. Info Needed on Atari 810 Floppy Drive

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-04 00:00:00 UTC
From: Charles Richmond <richmond@plano.net>
Message-ID: <33BDCBDD.7D72@plano.net>
Source record: 72054

I picked up an Atari 810 disk drive at a thrift store to complement
an Atari 800 that my uncle gave me. I have a few questions:

1) What is the power requirements (voltage and amps)? I did *not*
get a power transformer with the drive, althought I *did* get
the cable that connects it to the computer.

2) Is there a disk-based OS that I need to boot this drive? Can
I use it without and OS (i.e., is it optional)?

3) How does the Atari 1050 disk drive differ from the 810?

TIA.

9 Volts AC at 31 Volt-Amps (3.44444 amps @9VAC) is what's stamped on the bottom of my power supply for the drive I have. (that is a generic Atari power supply for peripherals like the 810, 850, and such)

>
> 2) Is there a disk-based OS that I need to boot this drive? Can
> I use it without and OS (i.e., is it optional)?

Yes, I believe the most common version is Atari DOS 2.0S (that's what I use most of the time).
No, you can not use it without the DOS.

>
> 3) How does the Atari 1050 disk drive differ from the 810?
>

As far as I know, the 810 is a full height drive in a beige case and the 1050 is a half height drive in a white case with brown and black faceplate.

There was a game I got from the Atari rep when I worked at the Byte Shop
in seattle way back when . . .

The problem is that I don't remember it's name.

It's sort of like the 2600 game KABOOM!.

It has about 3 or 4 rows of colored blobs across the top of the screen,
and they start falling, 1 by 1 at first and they get faster and more of
them drop at the same time as you go.

There is a paddle controlled bar (like breakout or arkanoid) on the
bottom of the screen and you are supposed to catch the
rocks/stones/balls/blobs (or whatever they are).

This one was very addicting and I wonder if anyone has seen this one?

I don't think it was released to the public, but was one of those
'internal' programs.

Thanks,

Gene.

Another way to use a modern RGB monitor with an 8-bit...

If you have a computer such as a Mac with AV capability, you can use its monitor with the Atari 8-bit by plugging the composite video and sound outputs into the video and sound inputs on the Mac. This is how I have mine set up at the moment. Works great--the picture is very sharp compared to a TV or composite monitor, though the colors bleed somewhat and some colors (like yellow) don't show up well. This should work on a Wintel PC with video input capability, I would think. (It's too bad nobody's done something like APE for the Mac...)

> Chris Laws

You need at least a 68040-based Mac (ie., Quadra series) or better, preferably a PowerPC-based Mac (PowerMac series), and a color monitor to run Rainbow. The Mac Plus isn't much faster (by today's standards) than the Atari 8-bits and doesn't support color at all. You need a much faster computer to do decent emulation, especially given all the custom animation/sound hardware of the Ataris. (Though there was an Apple II emulator that ran on a Mac Plus years ago...)

Yogi has it on one of the "mega" images on his site (#19). It seems to run fine with Rainbow... I couldn't get into his ftp site tonight, but the last I heard it was at ftp://myst.slcc.edu/atari/
There are also ATRs (including some other MicroProse stuff, but no Mig Alley Ace) at http://aegis.mcs.kent.edu/~clisowsk/mirrors/8bit:yogis_site/

Been fighting these two 1050 "Happy" drives for 2 months all by
myself. Tried a post or two for some help, but couldn't interest
anyone in my plight.
Now, with the help of a local 8-bit guru, it's been determined that
the boards in the drives aren't Happy Computing devices at all, but
are called Cheer-Up boards. Similar, but not the same. Does anyone
recall them at all?. Anyone have a Cheer-Up boot disk?. Do you suppose
the guru is just pulling my leg?. All are salient questions begging an
answer. Now I know that I don't really NEED these things. I can do
just about anything the Atari's can do with the magnificent A.P.E.
program --- but the fun, for me, of the 8-bit , is the playing around
with all the gadgets. Anyone?? anyone? oh yeah, I just aquired a
couple 64k Mosiac boards for the 800 hmmm, anyone THERE?
Thanks. James.

97. Info Needed on Atari 810 Floppy Drive

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-05 00:00:00 UTC
From: brad@pianosa.demon.co.uk
Message-ID: <868092993.7238.1.nnrp-2.9e9882d2@news.demon.co.uk>
Source record: 72061

Whilst reading the rubbish I usually find here, Charles Richmond wrote some=
thing interesting about "Info Needed on Atari 810 Floppy Drive"

Hello Charles,

[810 disk drive]
CR> 1) What is the power requirements (voltage and amps)? I did *not*

9V ac, 3.5A

CR> 2) Is there a disk-based OS that I need to boot this drive? Can

There are various DOS's around on disk, plus one on a cartridge. The "best=
"
Atari DOS would be DOS 2.5. After that, you've got choices like MyDOS,
SpartaDOS, SpartaDOS X (the cartridge based versoin, my personal favourite)=
,
plus a few others.

CR> I use it without and OS (i.e., is it optional)?

No, you *have* to run DOS, otherwise the Atari boots without registering th=
e
existence of a drive: During the boot process, the Atari looks for a valid
DOS. If it finds one, it loads it, so you can use the drive(s). If no DOS
is found, you can't use the drive.

CR> 3) How does the Atari 1050 disk drive differ from the 810?

For a start, it's ahalf-height device, rather than full-height. But the
major difference is that the 1050 offers enhanced storage capacity. Not
true double density, but more than the 810 can handle.

DOS 2.5 (and any of the other DOS's I mentioned) will be able to tell which
storage capacity is in use, and react accordingly.

I find that most of the problems with the XL-it are solved by running the emulator out of Windows95, rather than in DOS....In Win95, the flashing light for the wampus works, and you can catch him. Setting the sound volume is trickier, but I finally worked it out. That problem and solution would be different with each system, but I worked it out with my SB16 by copying the mixerset.exe file into my XLit directory, then set the volume from Windows before running the game.

In DOS, I did not have a wampus flashing light at all, no matter what settings I used in the environment.

Anyone know of any good MULE clones for AtariST or PC? (other than colony or mule386?) I am a real MULE fan.

Hello,

years ago, I played Lucifer's Realm on my ATARI 600XL. Although it was a great game, it was only in textmode. A friend of mine had an Apple II and there were some really weird graphics. Does anyone know if a graphical version of this game for our little ATARIs exists or not?

Yes, it does! I have the original, but it doesn't quite work. The graphics are on the disks, but it lacks in some locations! I guess the copy protection is messing it up or something! It's on four sides if I remember correctly! Take Atarian care everybody and if anyone got a working one, I sure would appreciate to get my original working again!

Popcorn is a version of the game you describe. Actually, this would be a good type of game to put together for beginning programmers to try out different programming strategies. You could use all player missle graphics to start, then maybe try vertical fine scrolling, use collision registers for detecting catches, then maybe try to do the whole thing using no PM stuff at all, which is how Apple computer programmers had to do it, since there were no hardware sprites on Apple IIs.

Same in the UK, there was a Lazer board that was pretty much a direct
ripoff of the happy (bar a few byte changes in the software)....

If someone could tell me where I could find XL-IT .20 I would really really really appreciate it.

I can't find it anywhere that is'nt shut down... If you could e-mail it to me I would really really appreciate it. I also Have an ICQ number. The emulators I have don't do a real good job. If anyone knows an emulator which is comperable to xl-it, I would try it. But Xformer just doesn't cut it.

J-me

Have I got a deal! I have an undisclosed number of the famous 1050
Cheer-Up clones of the Happy drive for sale. They seem to perform more
or less like the Happy's. Actually less .... much less. Ah, well.
Anyone have a Happy they want to trade or sell? Got all kinds of
routine stuff here: 800s, 1200s, 800XLs, 130XEs, 1050s, a Percom,
several Indus, XF551s, Koala Pads , etc.
Already got one Happy from Ron P. (great guy), but it needs another
setting on top of it. Just kinda' bored with the status quo. James.

When i get time I am going to release a new version of Pokey that uses
Ron Fries sound emulator. Just haven't been around the emulation seen
at all in about 6-8 months.

As you stated all aspects of Mule play fine with Pokey. When I get
Ron's sound in there it should sound good too.

Course you can have sound with Pokey now if you build the Sound
interface. You get near 100% sound that way. Great for games like
Berzerk where you still hear the digitized voice say "Got the
humanoid"! You wont hear that through the sound emulation.

I must say though that I am impressed with Ron's sound emulation.
Very nice. He had done alot of emulator users a big favor.

113. ATARI EQUPMENT MUST SELL!!!

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-06 00:00:00 UTC
From: starfleet@springnet1.com
Message-ID: <33bfea02.4027869@news.springnet1.com>
Source record: 71933

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV connector, original cost $599.00, Joysticks $19.95 each, asking $50.00 or best offer. These SELL AT Video 61 for $49.95 used.

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers, manual, power supply, connecting cables, oil, original cost $399.95. Also have a non-working 1027, can be fixed at any Atari service center, both printers cost new $399.95 each, asking $100.00 for both of them Again, these sell, each $49.95 at Video 61.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very good condition, like new, supports single and dual density modes, includes power supply, original cost $179.95, asking $75.00. These sell at Video 61 for $74.95, same price.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers. Upgrades and replaces the 6502C in the computer with the 16-bit 65C816 CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up programs as much as 350% faster. The 65C816 processes 4 instructions per clock cycle (Only the new P6, 80686 Intel chip does that, besides this), as compared to the 6502 which processes one instruction per clock cycle. Original cost $249.95. Includes T816 assembler $75.00, Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks, valued at $25.00 each. Asking $250.00 for the entire package. These are not currently available anywhere else that I know of.

ATARI 800XL upgraded to 256K memory, will run most 130XE specific programs, already wired for Turbo-816 installation, just need to re-solder 3 jumpers, and plug in the Turbo-816 kit above. Original cost $189.95 for the 800XL, $79.95 for the Upgrade kit, $65.00 for the 256K DRAMs, asking $125.00. Video 61 sells the USED 64K model for $59.95.

Supra External 2400 Baud Modem, includes powewr supply, no manual, Hayes Compatible, requires 850/P:R:/ATR8000, asking $30.00

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue
Decatur, Illinois 62522-1537

Will consider trading for a trak AT-D4 double sided disk drive NEED
ONE BADLY someone has to have one, or a trak double-sided slave drive.
MAKE OFFERS!!

114. Splitting up Yogi/Jellystone game packs

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-06 00:00:00 UTC
From: bhilchie@cyberus.ca
Message-ID: <33bf089e.1900780@news.cyberus.ca>
Source record: 71934

First of all, thanks Yogi, whoever you are, and anyone else at Jellystone park for that amazing collection of games!

What I want to do is run each game individually from a Windows front end. I assume this means putting each game on it's own virtual floppy disk, which is fine since hard disk space is not a concern. I've tried, but nothing I've done seems to work. I'm not a native Atarian so I'm sure I'm missing something obvious to you veterans.

Anyone have ideas, or have pointers to sites with info? Thanks!

Brian Hilchie

Whilst reading the rubbish I usually find here, rwoolley@pacbell.net wrote
something interesting about "Info Needed on Atari 810 Floppy Drive"

Hello rwoolley@pacbell.net,

>> No, you *have* to run DOS, otherwise the Atari boots without registerin=
g
rpn> well now,,,, there are a large number of commercial bootable programs=
=

I take your point, but under the circumstances which were being discussed
(as I read it, anyway) a DOS would be required.

rpn> that do not use DOS. I think the commie required a DOS, but the Atari

Of course, if I were picky, I could point out that, even those auto-booters
have their own mini-DOS in them, even if all it does is load a
game/whatever.

But that's only if I were really picky. :-)

It all depends what you mean by DOS: The way you appear to have defined it=
,
it's the full DOS.SYS DUP.SYS package. For the purpose of the above
illustration, I chose a different definition.

Just playing devil's advocate, not picking a fight. For a start, against
someone as knowledgeable as yourself, Atari-wise, I woudn't last until the
end of the first round.

Message-ID: <868191781.14124.1.nnrp-4.9e9882d2@news.demon.co.uk>
Source record: 71937

Whilst reading the rubbish I usually find here, Mark L. Simonson wrote some=
thing interesting about "Current Generation Video Monitors"

Hello Mark,

MLS> If you have a computer such as a Mac with AV capability, you can use
MLS> its
MLS> monitor with the Atari 8-bit by plugging the composite video and soun=
d
MLS> outputs into the video and sound inputs on the Mac. This is how I hav=
e

This implies that the monitor to be used has a composite video i/p, surely?

One way of using a true RGB monitor with the Atari is to stick the video
into the green i/p, assuming that there's no separate sync signal. I'm tol=
d
that it works, but I've not tried it myself.

No colour of course.... :-(

Grab a program called "ADIR" from the site (if its still there!) and
extrract & insert into each individual disk. However, you will have to
add a loader to each disk.... this will probably be more trouble then
its worth.

However, I'm not sure if Xlit (I assume you are using) will support
this: Xformer does, if you start xformer with a file as the parameter,
it will load that file as if it were a whole disk. You still must have
some kind of loader set as D1:, however, and only load the file as D2:
This would require writing some kind of program (on the atari)

Kind of ironic, we used to want to take full disks and make them
Files, now we want to go the opposite way..... I'm thinking about
re-indexing those mega images anyhows. Anyone got any ideas on how it
should be done ?? Year? Manufacturer? Whether the game sucks or not?

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession, are in desperate need of fresh material, and are more than willing to review photos submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE, ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY, ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY, HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES, RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes, your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send entire portfolio unless we ask for it.
SEND TO: Photo Phoenix International

One-Number service puts you in control of your calls while ensuring that your calls, messages and faxes reach you regardless of your location. One-Number service does this by linking your existing telephones, cell phones, pagers, and fax machines through a single telephone number.

YOUR One-Number ACCOUNT COMES STANDARD WITH THESE FEATURES
- Consolidates your phone, fax, voice-mail and paging services
- Works with your existing products and services, no need to change
- Easily lets you designate yourself as available or unavailable
- Rings you at up to three numbers simultaneously
- Never-busy number accepts multiple incoming calls and faxes
- Call Screening (by name) lets you know who is calling
- Call Waiting lets you know somebody else is calling
- Call Move lets you easily transfer calls among different phones
- Call Conferencing allows conferences with other parties
- Fax Notification on your pager for incoming fax messages
- Redirect calls to Personal Operator (live person) if desired
- AND MUCH MORE

Virtual Office Communications Company is not a phone company, a long distance carrier, nor do we sell telephone equipment, cellular phones, cellular service, pager or pager service.
Instead, we offer service to integrate your existing products, adding value to what you already have by letting your phones, pagers, fax machines and voice-mail systems work together seamlessly.

To learn more please visit our web site at: http://www.mynumber.com

Please do not reply by e-mail as we are not set up to respond to e-mail requests.

PLEEEEEEEEEEEEEEEEEASE give me information on programming Game Link I/O!!!
Generic or Action! code preferred. I can handle a BASIC example,
although I doubt BASIC can do Game Link. ;)

Thank you! I REALLY want to write multiplayer/multicomputer games,
and Game Link seems the way to go (since setting up a 2-player connect
takes 2 SIO cables and a paperclip, whereas a MUX setup requires like
3 computers and expensive hardware :))

Thanks!!

Check out DemoVille...

http://zippy.sonoma.edu/kendrick/demoville/

I'll be adding more demos, and possibly some soundbytes as time permits :)

So far, I've got screenshots (and links to download (you don't HAVE it yet?))
Hard's "JoyRide" and screenshots of Quasimodo's "Delerium Tremens" (detr)

Enjoy!

: ect.ect.ect

UMich has a few Euro. demos up! :) Come check out some screenshots of
a few at my new "Demoville" website! (There's a link directly into the
Demos directory of UMich, too)

http://zippy.sonoma.edu/kendrick/demoville/

: Has anyone ever thought of writing a Graphic Internet interface? I know
: the Atari can go on-line but you have to use a text only BBS sort of
: Program to acess it (bummer).

I would LOVE to do this! I would do it by writing a graphical term
program that accepted graphics commands and text input (it wouldn't actually
do much internet stuff), and then writing a (or a number of) Unix shell
programs which DID the Internet stuff and told the Atari program what to
display.

It'd be beautiful!

Too bad I don't have a modem for my Atari! Anyone willing to donate a
GOOD 14.4k (unlike the BAD 14.4k I have on my PC) and a GOOD modem
interface (unlike the BAD P:R:Connection I have.. or maybe it IS just
my modem?) to a GOOD (or at least COOL) cause?

Thanks!

do you have any short-instructions for "combat leader" ? I never was able
to play that game, because it was too complex.

> the scrolling map interface that Chris Crawford developed in

"Eastern Front" is imho boring, and has a very foolish game play.

> Bomber", and "Eastern Front".
> Are there any other ATARI wargamers here?

"Kampfgruppe" (SSI), War Game Construction Set (??), OGRE by Origin are
also great games.

I beg to differ on that point you can do all the disk basics with a
64 and drive WITHOUT any disk (format, load, save, get directories,
etc.) On the 800/1200 all you will get is boot error. You NEED a disk
to use the drive for the 8-bit Atari.

Fortunately I have finally gotten a boot disk, and will copy it if the
person e-mails me his address. On it is a term program, now I have to
get a serial interface made up (hopefully it won't be too hard to do..)

I need to free up a little shelf space, so I am offering the following list of software and hardware for sale. If you are interested, but don't agree with the price, please make an offer (the more that I can get rid of at once, the more likely I will be to take less per item!).

Money orders only, please. Shipping is NOT included. After I get a request, I will E-Mail you back with the total, including shipping. When I receive payment, I will ship the items out.

136. Re: MAE Assembler

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-07 00:00:00 UTC
From: jharris@sierratel.com
Message-ID: <33c278a7.45984257@news.sierratel.com>
Source record: 71952

Version 1.1 of the MAE assembler was just uploaded to ftp at
atari.archive.umich.edu.

I can also MIME EMail copies to anyone interested.

In addition to 6502 programs, this version can create 65816 code in the
full 24-bit address space. However, if you do have a 65816 CPU in your
machine, you should contact me for a special version. When assembled with
65816 opcodes, the editor is twice as fast, and the assembly speed is
faster too. You can also get additional debugger support for 16-bit regs
and stuff.

John Harris Japanese translation of Microsoft slogan:
jharris@poboxes.com "If you don't know where you want to go,
we'll make sure you get taken."

137. Umich - ARC or TXT - your choice

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-07 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5pq84egvv1@nuke.csu.net>
Source record: 71953

This is about the UMich Archive (btw, I've made some changes! :)
Check 00.CHANGES for them)

Let's have a vote. I'm wondering if I should leave the smaller TXT files
as TXT, and unARC any small TXT files that are ARCed (thus making it one
less step to get to the information), or should I ARC everything
(for faster download speeds).

I have this feeling that a LOT of you are accessing the net and would
probably be reading these documents on a PC or Mac. A lot of the files
I've been getting lately are also ASCII (not AtASCII) and in 80 columns...
(remember, get Itay Chamiel's col80, an AWESOME 80col text reader!)

Personally, I'd stick with TXT, rather than ARCing them.

What do you people say?

Thanks!

: faster too. You can also get additional debugger support for 16-bit regs
: and stuff.

Why not upload both versions? Or did you?

I would be interested in a tutorial, too! Like, examples of how to do
everything from "Hello World" to DLI's and music. :)

Also, recommendations for some good 6502 (esp. Atari-specific) and 65816
(hopefully generic) books would be a MAJOR help!

And John, wanna write a 65816-based high level programming language?
(I don't care if it doesn't create 65816 software, I just want a GOOD
development system! Hell, even something for Unix that makes Atari-ready
compiled software would be SUCH a HELP!)

141. UMich updates - 7/7/1997

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-07 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5pq979$hk6$1@nuke.csu.net>
Source record: 71957

Additions/changes to the Atari 8-bit archive at UMich!

Added "MAE" v.1.1 to Languages/Assembly/
Added "aceii.mod", "psycho2.mod", "trance.mod" and "xdrome.mod" to
Sound/Mod/
Added "atariwriter_convert" (a Mac HyperCard stack) to Text/Converters/
Added "effects.arc" collection of Info/Routines/
Replaced Demos/Mega/patros.blurb with a new, more descriptive copy
Added "flip side copy with myutil" doc. to Info/Hardware/
Added "Pro Tracker 1.5" (pt15.arc) MOD tracker to Sound/Editors/
Added "BMP2HIP" converter program (FOR IBMPC!) to Graphics/Converters/
Aded "MatherF----- Editor" (mferea11.arc) to Text/Editors/

These are all available from the Newitems/ directory (and will remain
so until the next update occurs, unless that's in less than 2 weeks or so).

I've found the easiest way to get into UMich is via Gopher:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

or via the Web (HTTP):

http://www.umich.edu/~archive/atari/8bit/

Good luck!

Randy,
Hey! Good to see you here. You saw my reply on JACS. I still haven't tried mine. Actually I tried, but I had no drives working on the 8-bit, so no sio2pc program there. At least my XF551 drives are now working, so when I get time/energy, I'll retry it. I built the 1 chip version.

Hope someone has info for you. Hmmm... Are you sure you have the connectors wired on the proper ends? It's real easy to get that mixed up.

RWC-
Of the war games you mentioned, I only played Eastern Front before.
It was interesting, but a little too complicated and frustrating.
In terms of playability and keeping my interest, Combat Leader is a
super game. Each battle set-up is different. I got very good at proper
troop deployment and strategy. I could even annihilate the enemy on the
"defend position" setting, where it starts off with an overwhelming
advantage to the enemy.
Many years ago, before Internet was around, I thought it would be
super to play Combat Leader against a human opponent (separate screens)
instead of the computer. With the limited "vision" of the battlefield,
this would be quite exciting.

Yes, I have a list in Austro.Text-format, including German describtions
for almost every program. It does not include software, I got past the
last few years, but I will convert it to pure ascii and mail it to you.

>No, you can not use it without the DOS.

Welll... for the sake of completeness, there _is_ a simple "disk handler" built into the Atari computer itself (its ROM, actually). This allows you to perform rudimentary "sector" I/O -- read a sector, write a sector, low-level format a floppy -- but THAT'S ALL. You have to use machine language (assembly) to access this functionality. In theory you could work your way up from there to a DOS of your own, but in practice that's probably NOT something you'll want to do. (Me, I'd be limited by my skill level, my amount of free time, and the desire to be able to read the millions of existing Atari DOS -compatible diskettes already in existence.) Nonetheless, using just the Atari and the disk drive, no DOS, you _can_ "store and retrieve" data on disk, in the very strictest sense.

Just thought I'd throw that in, for those who might be able to make use of it.

>(for faster download speeds).

Given disk sizes and modem speeds today, it's probably very unlikely that anybody downloads from UMich directly to an Atari -- but it's POSSIBLE (I'll be trying it soon, myself, with my Black Box). On the other hand, how portable/available is ARC? I don't have it on the Windows NT Alpha system in my office at work :-) and am fortunate to have even/only a very ancient version on the VMS system there. I'd prefer leaving TXT files as TXT files, wherever possible.

I'd also suggest that any TXT files which are kept _as_ TXT files, and which do NOT use ATASCII-specific properties (Atari graphics characters, inverse video), be stored in ASCII, not ATASCII; this will make them "accessible" to those non-Atari systems which are probably going to be used for at least PART of the downloading process, and eliminate the need for standalone ATASCII-to-ASCII conversion of same. If it is desired to transfer these files "all the way to the Atari," the ASCII-to-ATASCII conversion can be performed "on the fly" by any and every one of the Atari-side file-transfer utilities I've ever seen...

If "keeping some files in ASCII and others in ATASCII" is seen as a problem, in that "you won't know whether a file is ASCII or ATASCII," then I'd prefer that everything be kept in ATASCII, to preserve those files that DO use its properties, while continuing to support those which don't... If there's an interest in storing BOTH forms, then perhaps we should use something other than "TXT" as the filetype: .ASC for plain ASCII, and .ATA or .ATS for ATASCII, perhaps. (It would then be a relatively simple matter to tell e.g. the Windows (3.1, 95, NT) "file manager" (etc.) to treat .ASC files the same way as .TXT files, and fire up a custom ATASCII viewer for the .ATS files...

And given the sizes of disk farms today, what would it cost us, really, to store BOTH "plain ASCII" AND "ATASCII" forms of ALL TXT files on the archive? Even two versions of all ARCs that CONTAIN TXT files? Is that a feasible suggestion? Just make two parallel trees identical to what you

have now, one the "plain ASCII" version and the other the "ATASCII" version, and maintain them in parallel. Oh, joy, bet ya LOVE THAT idea, huh Bill? More maintenance work!!!! :-)

Just my two cents,
Chris

About what? Is this like an Atari game? "War On the NET"... that'd be
cool. Smacks of what I was writing about last night... doing Internet
WITH the Atari. Like, the Atari would be the front-end to a huge
multiplayer Internet game... just hook up a modem, dial into an ISP,
and viola! Cool! Thanks for the idea! (As if I hadn't had it before ;))

: Just search the Web - we're now the largest chain
: of WEB SITES on the net for supporting entrepreneurs

Why would one want a chain of websites? Why not just, like, a website?

: and businesses wishing to grow using his techniques. He gave
: them fair warning... But they didn't
: listen...

"his techniques" -- who? Who's techniques? No I'm confused.
Are these entrepreneurs using Ataris? I hate to say this, but even
the most die-hard Atarian realizes that even small businesses should
stick to PC's these days...

Are you sure you don't mean Amiga? :)

-Popular Computing Jan 1985 featuring the Tandy 1000
-Popular Computing Dec 1983 Featuring "the new 1984 Computers"
-Computers & Programs Feb.1984 Premiere Issue

-Compute Issue 74 July 1986
-Compute Issue 73 June 1986

Trades
==========
I may consider trades in the following areas, however sales at this point are more appealing to me and will take priority. As far as trades go, I am interested in the following categories...

Intellivision Rare Hardware and cartridges as well as Shrinkwrapped cartridges
Sears Tele-Games Shrinkwrapped Tele-Games (Intellivision) cartridges
Vectrex Hardware, Controllers and cartridges
Atari Lynx Hardware and cartridges
Atari Portfolio Hardware and accessories
Mattel Electronics Handhelds (especially Backgammon and Spead Freak), Aquarius computer items, etc.
Coleco Handhelds and tabletops, Total Control 4 carts as well as some ColecoVision items
Microvision Hardware and cartridges

Source record: 71972

HOORAY!
Problem solved.

With no manual, it was not immediately obvious to me that there were indeed TWO (2) switches on the back of the 1050. However, since the second switch (the white one) was directly behind the first switch (the black one) and sandwiched right up against it. It all looked like ONE SINGLE SWITCH to me... I finally noticed the other switch when I took the cover off the drive. I guess I shoulda broken out the Philips in the first place but live and learn!

Thanks for everyone's help!

Later,
Eric

From: jogar@bigfoot.com
Message-ID: <868329448.10758@dejanews.com>
Source record: 71974

(this message was originally posted to InfoMan's Atari page)
http://www.holyoak.com/atari/

I got the SIO2PC cable, and managed to create a 90K SD ramdisk, duplicate my DOS 3 master onto it, and then duplicate from the ramdisk onto a blank floppy (I lost my DOS backup disk, so I thought this was an important course of action). Then I tried to duplicate my Colonial Conquest by SSI disk into a ramdisk, but DOS 3 complained "Error 176: Format incompatible". I figured, Hmm, maybe that's what file2pc.obj is for. I loaded atari.atr into a ramdisk and tried to read from it, and I got the same error. Hmm, I mentally mumbled, maybe I have to use MyDOS to get anywhere. But I got error 176 when I tried to read mydos453.atr as well! What am I doing wrong?

It's very possible that the source code segments are from different
sources. One of them WAS Atari DOS.

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit
computers.

1972
Atari Inc. is formed by Nolan Bushnell; created the first coin-operated arcade
video game with the introduction of Pong. The video game industry was launched
and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), giving birth to home
video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using
the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400,
"Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design
Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now

heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Bus Interface (PBI), providing direct memory access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Today Atari Games is an indirect, wholly-owned subsidiary of the Midway Games division of WMS Industries.

WMS Industries Inc.
3401 N California Ave
Chicago IL 60618-5899
USA
http://www.wms.com/

Midway Games Inc. (a division of WMS)
http://www.midway.com/

Atari Games Corporation (a subsidiary of Midway Games)
http://www.atarigames.com/)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of direct memory access.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game, while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS Corp. subsidiary. JTS, with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer market. The company currently employs more than 5,800 people worldwide including manufacturing facilities in Madras, India.

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer...

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen

Aided Management) 80 column Desktop System; the Ultra Speed Plus OS;
the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing
improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give
rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great
games.

If you want to do something with a computer, chances are you can do it on an
8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far
less costly than any of these, is easier to program at the machine level or
alter at the hardware level, and has been documented more thoroughly than any
of the newer computing platforms. The relative simplicity in design of the
8-bit Atari also means that many people find the systems more reliable than
their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other
platform. For example, some Bulliten Board Systems are still run on 8-bit
Ataris specifically because the BBS software available can be better than that
for any other type of computer. There is a reason for the relative quality of
software on the 8-bit Atari. People program commercially for the latest PC's
to make money; people program the 8-bit Atari because they want to -- they
enjoy producing good software. It takes a team of specialized programmers to
develop a major piece of software for those other systems; with the 8-bit
Atari, a single person has the chance to learn the entire system, thereby
developing greater pride in his programming abilities and his final product.
The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was
developed years before the IBM PC or Apple Macintosh were even on the drawing
boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative
in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.78979 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
60 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:
ANTIC CIO/BASIC Display Resolution Number of
Mode # Graphics # Type (full screen) Colors
---
2 0 Char 40 x 24 1 *
3 - Char 40 x 19 1 *
4 12 ++ Char 40 x 24 5
5 13 ++ Char 40 x 12 5
6 1 Char 20 x 24 5
7 2 Char 20 x 12 5
8 3 Map 40 x 24 4
9 4 Map 80 x 48 2
A 5 Map 80 x 48 4
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16
luminances x 16 hues = 256 colors. (Four registers are for player-missile
graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video
incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four
2-bit wide, 128 or 256 byte high single color missiles are available.
A mode to combine the 4 missiles into a 5th 8-bit wide player is also
available, as is a mode to XOR colors or blacken out colors when players
overlap (good for making three colors out of two players!) Players
and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display
List - a program which is executed by the ANTIC graphics chip every
screen refresh:

All other screen attributes (color, player/missile horizontal position,
screen width, player/missile/playfield priority, etc.) can be ajusted
at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any
line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution,
8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4)
can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only
modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's
(for keyclick and buzzer) and in the XL's and XE's this was
(fortunately!) rerouted through the normal audio output, and the
keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following text was written by Chris Crawford and appears in De Re
Atari (Atari#APX-90008), a book published and copyright by Atari, Inc.,
1981-1982. It has been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different
from other systems. It of course has a microprocessor (a 6502), RAM,
ROM, and a (PIA). However, it also has three special-purpose (LSI) chips
known as ANTIC, GTIA, and POKEY. These chips were designed by Atari
engineers primarily to take much of the burden of housekeeping off of the
6502, thereby freeing the 6502 to concentrate on computations. While
they were at it, they designed a great deal of power into these chips.
Each of these chips is almost as big (in terms of silicon area) as a
6502, so the three of them together provide a tremendous amount of
power. Mastering the Atari 8-bit computers is primarily a matter of
mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor
dedicated to the television display. It is a true microprocessor; it has an
instruction set, a program (called the display list), and data. The display
list and the display data are written into RAM by the 6502. ANTIC retrieves
this information from RAM using direct memory access (DMA). It processes the
higher level instructions in the display list and translates these instructions
into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television
Interface Adapter") is a television interface chip. ANTIC directly controls
most of GTIA's operations, but the 6502 can be programmed to intercede and
control some or all of GTIA's functions. GTIA converts the digital
commands from ANTIC (or the 6502) into the signal that goes to the
television. GTIA also adds some factors of its own, such as color
values, player-missle graphics, and collision detection.

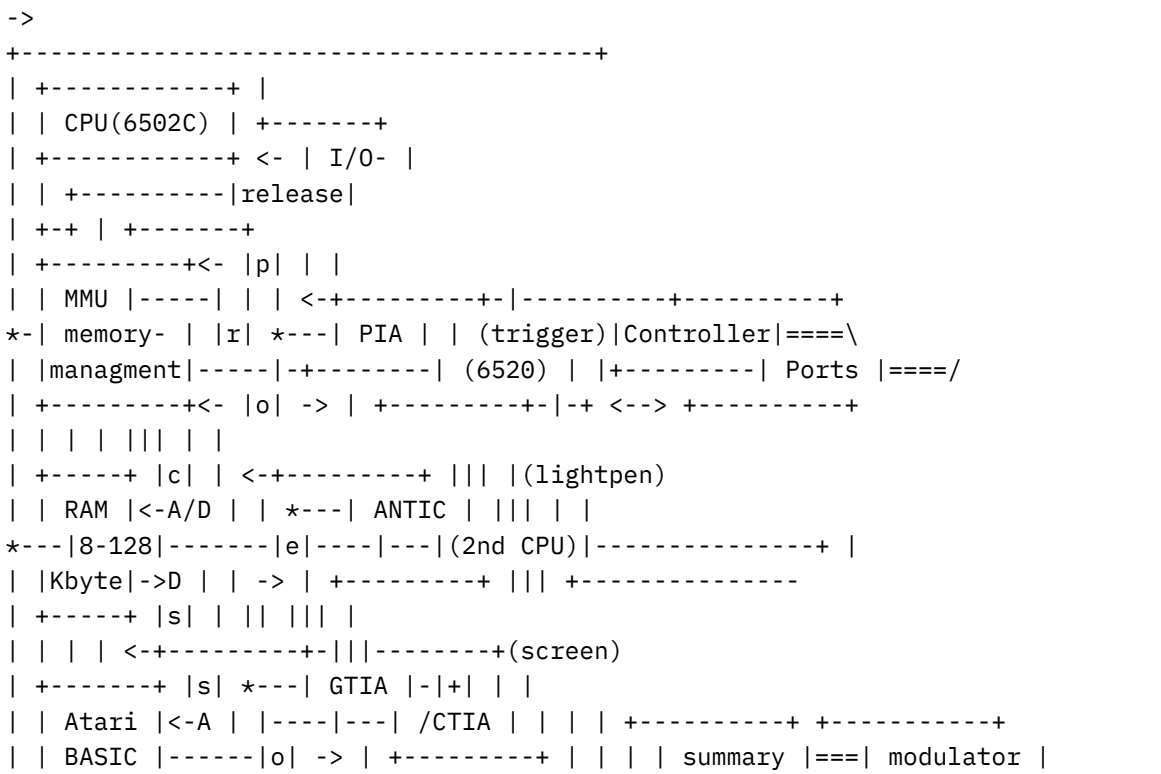
POKEY is a digital input/output (I/O) chip. It handles such
disparate tasks as the serial I/O bus, audio generation, keyboard scan,
and random number generation. It also digitizes the resistive paddle

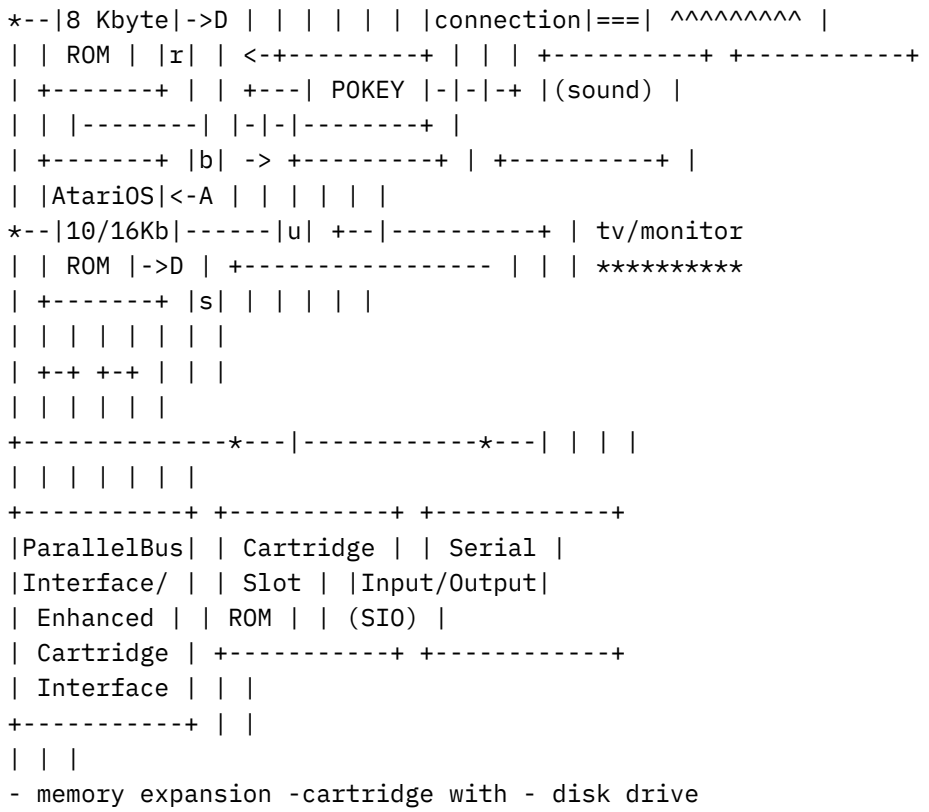
inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@closer.brisnet.org.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

Hardware Arrangement (With thanks to mailto:peter@soemtron.sb.sub.de (Peter))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800:8/16/48K,1200XL/800XL/65XE/800XE/XEGS:64K,600XL:16K,130XE:128K
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only
* ECI is on 130XE/800XE only

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit,
presumably because the custom of drafting charters for new newsgroups did not
exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Opinionated discussions about Atari computers. Unmoderated.

news:comp.sys.atari.announce
Announcements related to Atari computers. Dead newsgroup?
Moderated by Yat Siu, mailto:lexicor@world.std.com

news:comp.sys.atari.programmer
Programming Atari computers. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.1) What is INFO-ATARI8?

INFO-ATARI8 is an e-mail list for discussion about the Atari 8-bit family of
computers.

To subscribe to INFO-ATARI8, send a message to:
mailto:listserv@vm.marist.edu
that says:
subscribe info-atari8

INFO-ATARI8 is moderated by mailto:snyder10@MAILHOST.TCS.TULANE.EDU (Mike Todd)

INFO-ATARI8 was created on December 9, 1986.

Subject: 3.2) What is the Independent Atari 8bit Network?

Date: Fri, 29 Nov 1996 10:37:26 GMT
From: mailto:tomhunt@bright.net (Tom Hunt)

Closer To Home Enterprises is happy to announce the grand
opening of the IA8N's QWKNET. IA8N = Independent Atari 8bit Network.
This network is ran by a group of volunteers that are dedicated, hard
core 8bit owners.

I am seeking more individuals to join the network.
Individuals who join this network will receive weekly, or biweekly QWK
packets through internet email. These packets contain messages from
member 8bit bulletin boards and from individual members of the
network. These packets are ARCed and UU enocoded. Both ARC and UU
encoders are readily available for almost every type of computer
system, including the Atari 8bit.

Highlights from recent message threads include:

A member's recent pilgrimage to Poland to meet with
various developers. He reports about a new IDE interface
and Sparta Dos X clone for the 8bit.

Discussions about the new HIP graphic format. Announcment
of the release of the new HIP slideshow program, and
where to download it.

Discussion about David Hunt's (no relation) release of
Carina 2.7 into shareware, and where to download it.

Discussions about how to use the 8bit to access the internet,
including hot 8bit places to visit. There are tips about
which lynx servers are the best to use, how to do dns lookups,
and free telnet bbses.

Discussions about Larry Black's soon to be released ZSEND
program.

Message bases that are currently available are:

General
Internet
Programming
Hardware
User's Groups
Whine Base
Recipe
Pets

When an individual sends back a REPly packet to the network,
ARC must be used for compressing the packet. But UU, HEX, and MIME
encoding of REPlies is allowed.

The message bases have thousands of messages, many of which
contain information and references to programs that cannot be found
anywhere, even on the internet. So join the QWK Net today. This is

a FREE service to the 8bit community. Ask about a sample QWK packet,
so that you can see for yourself.

Send inquiries to: mailto:tomhunt@bright.net

"QWK Net, an Atari 8bit network, 100% managed, maintained, and
published via internet email on an Atari 8bit computer."

Subject: 3.3) What is CLASSICCMP?

From: bill@booster.bothell.washington.edu (Bill Whitson)
Date: Wednesday, March 12, 1997 7:08 PM

Hi all.

I have just started a new discussion list for people who
collect/maintain old computers. If this kind of thing
interests you read on...

CLASSICCMP - The "Classic Computers" Discussion List

NAQ (Never Asked Questions) 0.1

What is it?

This list is for the discussion of Classic Computers -
primarily for those people who collect and restore
old machines. It is brand new - no subscribers yet
so sign up. The collection and restoration of computers
is becoming a big enough hobby that I felt a need for
a place to talk about it.

What is a classic computer?

Well that's hard to say but since I created the list I'll
do it anyway. A classic computer is a machine that has not
been produced for 10 years or more. It's an arbitrary
definition but at least uncomplicated.

What are the guidelines?

The list is designed for discussion of collecting, restoring,
and maintaining old computers. I'm not going to be heavy
handed with restricting discussion. I'd just like it to be
clear that the list is not the proper place for discussion
of technical problems with the standard PCs and Macs (other
than the really old stuff). Anyone can lurk - if you're
going to post, just use your own good judgement.

This IS NOT and will NEVER BE a list for discussion of "which
computer is best?" and anyone who posts the ubiquitous "why
don't you just go buy a PC you moron" will be immediately
unsubbed.

Beyond this - have fun! That what keeps us going with these
old machines.

How do I subscribe?

Subscribing to this list is slightly more challenging than
most. Read the instructions below.

1. Send a message to listproc@u.washington.edu with the line

subscribe CLASSICCMP your-address

in the body of the message.

2. Send a message to bill@booster.u.washington.edu introducing
yourself and explaining why you wish to be added to the list.

That's it. I require the letter of introduction for several
reasons. 1 - Only people who really want to be on the list
will bother. 2 - If you can't follow directions I won't hear
from you. 3 - It helps me get an idea of who's on the list
and what they hope to get out of it. 4 - I like to respond
personally to new members rather than run a robot list.

Subject: 3.4) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all
polish- speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:kendrick@zippy.sonoma.edu (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory

"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/
gopher://gopher.orst.edu:70/11/g-i-s/computer/zftparea/mirrors/archive.umich.edu
/atari/8bit

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

A mirror web site:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are
several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://ftp.orst.edu/pub/mirrors/archive.umich.edu/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/ (<-- RECOMMENDED)
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://ftp.toad.net/pub/umich/8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How can
I retrieve files from FTP sites by e-mail?"

Uploading

General uploading tips:
- No uploads may be made to the Archive's mirror sites.
- Please also upload a short text file describing what your upload is. You
might also suggest what permanent 8bit subdirectory you'd like your file to
end up in.

- Note that the 8bit/New directory is "write-only."

1) upload via AFS:
Just copy files into file:///afs/umich.edu/group/itd/archive/atari/8bit/New/

2) upload via FTP:
FTP to atari.archive.umich.edu, cd into "8bit/New", and upload your files.

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

3) upload via E-Mail:
Simply uuencode the file and mail it to mailto:kendrick@zippy.sonoma.edu
(Bill Kendrick).

Subject: 4.2) What is the Boston Archive?

Here's an 8-bit Atari FTP site located at Boston University. It is
maintained by Adam Bryant, mailto:adb@albert.bu.edu . This site seems to
have seen no uploads for years, but there are some files here that aren't
on any of the other sites. [IS THIS SITE LOST? - 10/13/95]

ftp://cs-ftp.bu.edu/PC/ATARI (128.197.13.20)

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no
(Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software
Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate
directory. Please include a readme file with each upload, so people know
what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

This smallish 8-bit Atari FTP site is maintained by Kevin Atkinson,
mailto:kevina@clark.net .

ftp://ftp.clark.net/pub/atari (168.143.0.2)

Write to Kevin for uploading instructions.

A mirror of the ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Slovakian Archive?

This FTP site contains some demos, games, utils, zines from all the world.
Here you can also find some Slovak or Czech stuff.

Contact: mailto:mchorvat@econ.umb.sk (Marco, of GMG)

ftp://svs.scsss.sk/pub/atari/

Subject: 5.1) What is the Cleveland Free-Net Atari SIG?

Internet access to the Cleveland Free-Net (Cleveland, Ohio, USA):

telnet://freenet-in-a.cwru.edu or
telnet://freenet-in-b.cwru.edu or
telnet://freenet-in-c.cwru.edu

Type "go atari" at any menu.

Contact:
mailto:xx004@cleveland.freenet.edu (Atari SIG)

Subject: 5.2) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.3) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 7.1) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:76702.1076@compuserve.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal
programs available.

BobTerm 1.22, shareware by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes

Summary: Feature-filled; excellent for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Combination VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Excellent at VT100 on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus
filename: ?????

Ice-T XE v. 2.72 (128K) or Ice-T 1.1 (48K) by Itay Chamiel
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen
File Xfer: XMODEM download
Autodial: Yes (2.7 XE) or No (1.1)
Backscroll buffer: Yes--8 screens (2.7 XE) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.7 XE) or No (1.1)

Summary: Excellent for high-speed VT100 emulation

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually

the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:conradus@plearn.edu.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.

For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 12.4), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (James R. Gilbert)

A: Simply put, you need a terminal program and an RS 232 port on
each computer. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 bps, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. (Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25-pin
port.)

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'
side, 12 holes on the 'short' side. The numbers go from
#1 on the right to #13 on the left on the 'long' side
and from #14 to #25 from right to left on the 'short'
side. #25 is closest to being under #13. A male
connector is the mirror image of this.

Most terminal programs allow a null connection, without a
carrier detect. Notably, '850 Express!' does not.

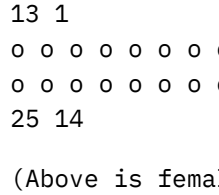
A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors and some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modem and plugging in the null modem cable. This also avoids the confusion of the wide variety of serial port jacks on different computers. Almost all computers connect into the modem via a DB25 connection.

The SIO port on the Atari cannot be used directly. An 850 Interface Module, P:R:Connection, Multi I/O, Black Box (by Computer Software Services) or similar device that provides an RS232 port must be used.

On the Atari, the port is a female DB9. So you need a male DB9 to male DB25 modem cable to connect to your modem. So why not use this cable as your null modem cable as well?

For higher speed connections, above about 9600 bps on the 8-bit, you need the flow control lines. You also need a Multi I/O or Black Box, which use the PBI (parallel bus), then you can go higher than 9600 bps.

Following are pin assignments for a DB25 pin RS 232 C port.



(Above is female, male is mirror image.)

1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

A high speed cable would need not only pins 2 and 3 crossed but also pins 4 and 5 as well as 6 and 8. Or better yet, make a true 25 wire, straight through cable and use a commercial null modem. A commercial null modem is just a small device with the correct lines already crossed.

(DTE = Data Terminal Equipment, i.e., your computer.
DCE = Data Communications Equipment, i.e., your modem.)

Subject: 12.1) What 5.25" floppy disk drives are available?

SS SD/DD Slave

==> Indus GT
SS SD/ED/DD Synchromesh mode usable with SpartaDOS X and
DOSXL only.

==> Astra Double-D?
SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- Ultra Speed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:

- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- Ultra Speed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic
- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2001
SS SD/ED/DD 19200 bps or 38400 bps
CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB

= 'cylindric' DS/DD 360 KB (XF-551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.
Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: My-DOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF-551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatibel with the SDX)
- Ultra Speed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF-551.

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

- Amdek
- XF551 upgrades (CSS)
- Floppy Board (CSS)
- Percom drive upgrades

==> Atari XF521
3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (76702.1076@compuserve.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

==> MSC IDE-Harddisk-Controller
created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at

one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration
* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What is SIO2PC?

Original text by Dave Paterson, mailto:davepat@total.net

SIO2PC is a cable and software combination that lets you use your PC as up to 4 drives for your 8-bit. Drives can be SD, ED, DD or custom sizes up to 16 megs. SIO2PC also lets you redirect the printer output to your PC printer or to a file on the PC. High speed drives are emulated (a la US Doubler).

All these functions are transparent at the Atari end; you never notice the difference between SIO2PC and regular drives, except that the SIO2PC drives are faster than any others (except Ramdisks and PBI interface drives).

Several different designs for the SIO2PC hardware are floating around. Best contact the author for the latest details.

SIO2PC 4.13 is shareware by Nick Kennedy, mailto:nkennedy@cswnet.com

---

Subject: 12.5) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the Commodore 1702 and 1804 (and many others).

The pinout of the Monitor port is in the pinout section of this FAQ list.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the 800XL lacks separate chroma/lumi (can be added via hardware modification)

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\lumi signals

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g is disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS is available from Fine Tooned Engineering (see companion vendor/developer list). SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

Peripherals:
410 Program Recorder -Japan and Hong Kong versions
810 Disk Drive -SS/SD 90K with DOS 1 or DOS 2.0S,MPI&Tandon vers.
820 40-Column Printer -
822 Thermal Printer -40 col.
825 80-Column Printer -req. 850
830 Acoustic Modem -300 baud req. 850, with Telelink I software
835 Direct Connect Modem -300 baud, with Telelink II software
850 Interface Module -4 9-pin serial, 1 15-pin parallel ports, beige &
black metal versions
1010 Program Recorder -Sanyo and Chelco versions
1020 Color Printer -40 col.(80 by command) print/plot in 4 colors
1025 80-Column Printer -7-pin dot matrix
1027 Letter-Quality Printer-80 col. letter quality =Mann-Tally Riteman LQ
1029 Printer -7-pin dot matrix, same as Commodore MPS-801
1030 Direct Connect Modem -300 baud, with ModemLink software
1050 Disk Drive -SS/ED 128K with DOS 3 or DOS 2.5
1064 -64K RAM module for 600XL
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem -300 baud, with XE Term software
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
600 600XL, all black case
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
1250XLD Earlier name for the 1450XLD
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" floppy drives
1450XLD 1400XL plus 5.25" floppy drive

1600XL ????
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -Z-80 CPU, 64K RAM, CP/M 2.2 OS, 80 column display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -non-impact color printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz
==========
9 V AC 5.4 VA (600 mA) Atari#CO62195 transformer:

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
This BBS was written in BASIC by the Atari Computer
Enthusiasts computer club (was it the Michigan chapter?). It included
designs for a ring-detector. You needed a sector editor and had to
allocate message space by hand, hex byte by hex byte.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most

of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and

comes with a "dial out" screen so that the Sysop can use the BBS as a terminal program to call and fetch files without having to bring the BBS down and reload a terminal program. OASIS supports "Door programs" which it refers to as "OASIS PAL modules". This OASIS demo module comes with an excellent message system. The OASIS file system is one of the most complicated that I have ever seen. It consists of "file libraries" with suites of "file types". There is quite a bit of overhead involved in performing a download (which may be a good thing, as it discourages file hogs). There is a commercial version of OASIS called "OASIS IV" that performs networking. There was an OASIS network between Boston, Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank Walters wrote it.

o Carina BBS -- a product of Shadow Software. See the Vendor list.

o BBS Express! Professional -- a product of K-Products. See Vendor List.

o OASIS IV -- a product of ???

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:offen300@hio.tem.nhl.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

Part# Version
~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.
~~~~~~~~~~~~~~~~~~~~

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section written by Freddy Offenga, mailto:offen300@hio.tem.nhl.nl

The following Operating Systems exist for the Atari 8-bit:

Rev.	System(s)	Models	Size	Part Nr(s)
A	NTSC	400/800	10kB	CO12499B, CO14599B, 12399B (*)
A	PAL	400/800	10kB	CO15199, CO15299, CO12399B
B	NTSC	400/800	10kB	(?)
B	PAL	400/800	10kB	(?) (*)
1	A NTSC/PAL	1200XL	16kB	CO60616A, CO60617A
1	B NTSC/PAL	1200XL	16kB	CO60616B, CO60617B (?) (*)
1	NTSC/PAL	600XL	16kB	CO62024
2	NTSC/PAL	XL/XE	16kB	CO61598B
3	NTSC/PAL	XE	16kB	C300717
4	NTSC/PAL	XEGS	16kB	C101687

(?) more information or confirmation required

(*) these versions should exist, although I've not seen them.
If you have one (or more?) of these, please contact me.

NOTE:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Breakout, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor.

Thanks to mailto:jlodoen@shell.portal.com (Jeff M Lodoen) for initial info.

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do

it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector
editor on a program called Pharaoh's Pyramid, from Master Control Software.
On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me
to thinking, what does that mean? After about 5 months of playing around
with the Omnimon board, I figured out how to use it to pirate software.
In fact, it can be used to make most boot disks into binary files, and remove
copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened
the demise of the Atari 8 bit computer by 2-3 years, because of its power.

Subject: 13.11) What is the difference between NTSC and PAL machines?

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines
displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they
refresh the screen 50 times a second doing 1/2 the lines each refresh
so they effectively repaint the screen 25 times a second. NTSC is
525 lines/screen with a 60 times a second refresh - again only half
the lines each refresh so a 30 times a second frame rate. This
would change the amount of time available during vertical sync pulse,
and the number of lines that need to be redrawn each time.

Subject: 13.12) What programming languages are available for the Atari?

Revision : 1.0
Date.... : 4/20/1997

==
!!!! This section is under construction - HELP WANTED !!!!

The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include;
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- Assembler Interchange Format, Project description
Version 2.2, 2-2-1997, Freddy Offenga

If you like to help or if you've something to add already,
just contact me. There's still a lot work to be done....
Freddy Offenga, email-to: offen300@hio.tem.nhl.nl
==
There are quite a lot! To get some structure in this section it's
divided into the following catagories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

[D] = available on disk
[C] = available on cartridge

a) ASSEMBLER
- 130XE+ Makro Assembler v2.2, 1992 (Torsten Karwoth) [D]
Two pass 6502 assembler/editor. Supports extra RAM.
Highly compatible with Atmas II.
- Alfasm, Version 1.0, 1990 (Jeff Williams) [D]
Supports 65816 instructions (for the Turbo-816 upgrade
from DataQue Software). This assember is also known as
the Turbo-Assembler/16.
- Atari Assembler/Editor, 1981 (Atari) [C]
Two pass 6502 assembler/editor.
- Atari Macro Assembler, 1981 (Atari) [D]
Two pass 6502 assembler/editor.
- Atmas II Makroassembler, 1985 (Peter Finzel, Hofacker) [D]
Macro assembler with integrated editor and monitor.
- Bibo Assembler, 1986 (Compy-shop) [D]
- Datasm/65 assembler, Version 2.0, 1981 (DataSoft) [D]
Two-pass 6502 assembler.
- EASMD, Version 1.0, 1981 (OSS) [D]
- MAC/65 Macro Assembler, 1982 (OSS) [D/C]
Two pass macro assembler/editor.
- MAE, 1996 [D]
Supports 6502 and 65816 mnemonics.
- Nasm65 assembler, 1992 (Nat!) [D]
Highly portable cross assembler (written in C). Initially
made for the Atari ST. Highly compatible with MAC/65.
- PC-65 Assembler, Version 1.0 beta, 1996 (Jan Feenstra) [D]
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.
- Synassembler, 1982 (Steve Hales, Synapse Soft) [D]
Two pass 6502 assembler.
- ST-65 Assembler, 1991 (A. Stauffenberg, F.Offenga) [D]
A cross assembler for the Atari ST (written in 68000 asm).

b) BASIC
- Advan BASIC Compiler (Advan Language Designs)
- Atari 800 Basic, Version 1.0, 1981 (Microsoft) [D]
- Atari BASIC, Rev.C, 1983 (Atari) [C]
- Atari Microsoft BASIC II (Atari) [C]

- BASIC A+, Version 3.05, 1981 (OSS) [D]
- BASIC XL (OSS) [C]
- BASIC XE, 1985 (OSS) [C]
- Turbo Basic XL (Frank Ostrowski, Happy Computer) [D]
Interpreter, Version 1.5, 1985
Compiler, Version 1.1, 1985

c) C
- ACE C (John Palevich & Ralph Walden) [D]
This is a newer version of 'Deep Blue C'.
- C/65, Tiny C (OSS)
- C65
- CC65, 1989 (John R. Dunning) [D]
This public domain package includes; compiler, linker,
assembler and object librarian.
- CC8
- Deep Blue C, Version 1.2, 1982 (John Palevich, APX) [D]
Drawn from Ron Cain's public domain C-compiler.
- DVC C, Version 1.01, 1985 (Ralph E. Walden) [D]
- LightSpeed C, Version 1.08, 1986
(Clearstar Softechnology) [D]

d) PASCAL
- Atari Pascal, Version 1.0, 1982 (APX-20102) [D]
- Draper Pascal, Version 1.5, 1983 (Norm Draper) [D]
- Kyan Pascal, 1986 (Kyan Software) [D]
Package includes; compiler, linker and assembler.

e) LISP
- INTER-LISP/65, Version 2.1, 1981 [D]
(Special Software Systems, DataSoft)

f) FORTH
- ValForth (Valpar International)
- Extended fig-Forth (APX-20029)
- fig-Forth, Version 1.1 [D]
- fun-Forth (APX-20146)
- Grafik-FORTH
- QS Forth (Quality Software)

g) PILOT
- Atari PILOT, 1980 (Atari) [C]

h) LOGO
- Atari LOGO, 1983 (LCSI, Atari) [C]

i) All the rest
- Action!, 1983 (OSS) [D/C]
- Quick, Version 2.0, 1990 (Raindorf Soft) [D]

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List."

Available via these locations and Usenet FAQ archives everywhere:

http://www.faqs.org/faqs/atari-8-bit/vendev/

ftp://rtfm.mit.edu/pub/faqs/atari-8-bit/vendev

news:comp.sys.atari.8bit news:comp.answers news:news.answers

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

---

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

InfoMan (Trevor Holyoak), mailto:infoman@poboxes.com maintains a list called "Atari 8bit Support BBS's."

http://www.holyoak.com/atari/ATARIBBS.TXT

Subject: 14.3) Where is my nearest 8-bit Atari user group?

Rich Tietjens, mailto:atari@teleport.com maintains an Atari computer user group list at:

http://www.teleport.com/~atari/ugbbs.htm

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Unofficial Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

If you would like a text-only version you can send e-mail to:

mailto:kendrick@zippy.sonoma.edu

with the following as the subject:

send emulator faq

Note that the "better" version (which the text version is based on) is:

http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

Subject: 14.5) Can I use an emulator to run my old Atari software on my new computer?

"The Unofficial Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:kendrick@zippy.sonoma.edu (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

If you would like a text-only version you can send e-mail to:

mailto:kendrick@zippy.sonoma.edu

with the following as the subject:

send emulator faq

Note that the "better" version (which the text version is based on) is:

http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by David A. Paterson, mailto:davepat@total.net or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:nadkar@fh-pforzheim.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin, mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

What I seem to recall about the Cheer-up upgrades was that they WERE by
Happy Computing. I believe they were for people who purchased the DT
Duplicator which was a Happy-type clone. The Cheer-Up was to make them
"Happy" drives... get it? :)

164. 8-bit softwarelist

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-08 00:00:00 UTC
From: Rene Gambke <rega@uriela.in-berlin.de>
Message-ID: <33C2758B.33F0@uriela.in-berlin.de>
Source record: 71884

Hi folks!

After 8 years, I discovered my old softwarelist for ATARI 8-bit. It
contains more than 1000 programs, disks, files and manuals. Almost every
program is commented - in German ;-)
If you are interested and hoping to find something you are still
missing, you can browse to:

http://www.in-berlin.de/User/powerslam/liste.txt

Maybe, someday I will also design english pages ...

The mortal THOMAS RAUKAMP wrote:
: Hi all!

: Is it possible to use a XE as a MIDI-seqencer?

Oh, yes. I have MIDITRACK III, the best sequencer for the Atari 8-bit,
and a kid brother to the ST Miditrack program. It has a generous
total-note-count due to using the banked RAM. Unfortunately its disk
handling is atrocious, however, as it stores to a custom floppy format.

> loaded atari.atr into a ramdisk and tried to read from it, and I got the
> same error. Hmm, I mentally mumbled, maybe I have to use MyDOS to get
> anywhere. But I got error 176 when I tried to read mydos453.atr as well!
> What am I doing wrong?

The problem is your trying to use DOS 3, the mutant step-child Atari
producted and then quickly hid in a dark closet. DOS 3 is incompatible
w/ virtually all software, and wont be bothered w/ 99% of any disks
since they are in DOS 2 compatible format.

Try booting the mydos453.atr image you have, its is one of the best DOS 2
compatible disk operating systems.

If you need any additional help feel free to e-mail me.

Bill, keep the stuff as text files as long as possible. I have an unarcer for the PC, but I'd probably null-modem the files to my Atari from the PC and then unarc them if I had to. That's my case.

I'd have to assume that there are many who don't have those options, and for them the text files should probably remain text files.

Ok... so far, it's been unanimous. I'll be keeping all newly submitted
TXT files as TXT files, for easier browsing/viewing. I'll also start
decompressing any ARC's which contain single TXT files. (If they contain
multiple, or include other files, they'll obviously remaine ARC.)

Source record: 71894

Whilst reading the rubbish I usually find here, THOMAS RAUKAMP wrote someth=
ing interesting about "XE as MIDI-sequencer?"

Hello THOMAS,

TR> Is it possible to use a XE as a MIDI-seqencer?

Yes, but you'll need to get hold of the hardware: Usually an object that
plugs into a serial port. So, you're likely to need something like an 850,
or P:R:Connection, too.

There used to be a MIDI suite available for the Atari (certainly it was
available in the UK), what it's current status is, I have no idea.

If you're able to build electronic circuits, I've got a circuit diagram for
a MIDI i/f. It's a bit out of date (it uses a 1488 & 1489, rather than a
MAX232) but it works. If you've got any idea what I'm talking about, it
probably wouldn't be too difficult to re-work the cct. for a MAX232.

My 1050 is mofified with a board called a "Smirk". I think it was
basically a "ripoff" of the Happy board. It runs all the Happy
software, duplication,

I think the board was manufactured in Texas.

178. for sale: Atari Items

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-09 00:00:00 UTC
From: bx557@torfree.net
Message-ID: <ED15KJ.6J6.0.bloor@torfree.net>
Source record: 71898

I have the following items for sale:

Atari 800XL - This one is in pretty crappy physical condition, but works great. The brown plastic piece around the keyboard is missing. The rest of the case has been painted white. It has a seperate audio output connected directly to the pokey chip. This bypasses several of the Atari's annoying noises, including the keyclick and that buzz you hear when using the modem. Right now this is just two wires coming out of the back of the computer, but you could attach a RCA or 3.5mm jack and connect a pair of computer speakers. I've really abused this Atari, and because of it's apperance I don't expect to get too much for it. I'm asking $12.

1050 drive, stock, with power supply and SIO cable. $15

Rana 1000 drive, double density, 180K, has track display, write-protect, diagnostics, and can format a disk without being connected to the computer. Include power supply and SIO cable. $20

Coleco ADAM disk drive power supply. This power supply works great with a 1050 or 400/800/1200XL. $5

I also have loads of Atari software. I'm not going to list everything here. If you're looking for something, ask me and I'll let you know if I have it. Note most of this software is productivity software, I have a few games.

Compute's 1st Book of Atari. $5
Compute's 2nd book of Atari. $5
Take both of the above books for $8

These prices do not include shipping. I am in Dayton, Ohio.

and setup but the cable fails to work.. what should I do?

180. "Zoop" clone..

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-09 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5pvfnk$q6$2@nuke.csu.net>
Source record: 71900

I played Zoop for the first time (on my Play Station) the other day,
and thought it'd be a pretty simple game to write. At least, a simple
version of the game (ie, it wouldn't have all of the same levels/etc.
that Zoop has, since I don't know exactly what they are! :))

I've already began coding some of the skeleton of the program (not even
any game code! man, it's been a while since I did Atari 8-bit programming!),
and wonder if it'd even be worth it.

For those unfamiliar, Zoop is a high-speed "kill the colored objects"
puzzle-type game. Some of the better qualities of it would unfortunately
probably be lost in my 'conversion,' since they're based on nifty 3D
special effects and digital sound.

But, it'd still be fun to write.

Anyone interested? anyone want to write some music for it? :)

oh, and what should I CALL the game?

Yes, but in this "netscape" era, it's just added steps for people to
download the file, then unarc it, then open a text editor, then view it.
It's easier to see it 'inline' in the browser. (Browser can include,
of course, Lynx :) Thus making Atari access easier, too! :))

Source record: 71902

Dammit! How many times do I have to ask? I KNOW you're out there!
I KNOW you want to write a game! WHat's stopping you!? :) TELL ME!

I'm interested in working on projects on the Atari to make some good
high-quality games.

My coding abilities suck, because I'm too much of a whimp to handle the
constraints of 64K / 6502 / Action!

My ideas (although most of them are based on existing games for other
platforms) are good though! :) (unlike many of the better demo coders...
how many damned mouse-based puzzle games do we NEED!? :) And Hard Soft..?
Your only game so far is a PONG CLONE!? :))

Please e-mail me or follow-up to this post so we can brainstorm, and so
I can tell you my ideas. BTW, I'm happy to do all of the graphics as long
as you do the code and music ;)

HELP!

Thanks!

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

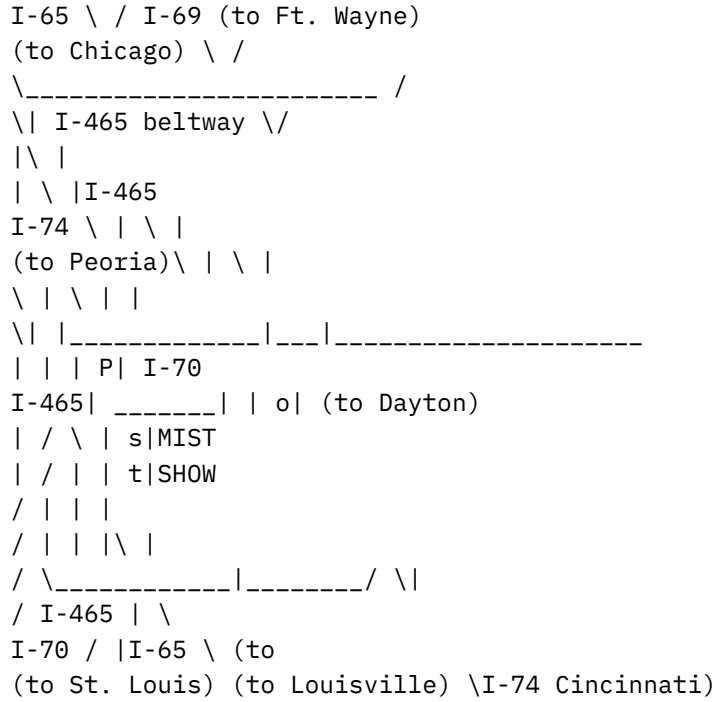
WHAT: 9th annual (final) MIST Atari Show.

WHERE: Indianapolis, Indiana, USA.

WHEN: Saturday, July 26. 10 am to 3 pm, Indiana time. (Same as
Central Daylight time.)

SITE: Post Road Community Center, 1313 South Post Road.

DIRECTIONS: Post Road is located between exit 90 of I-70 and
exit 96 of I-74, outside the I-465 beltway, on the southeastern side
of the Indianapolis area. See map below.



ORGANIZERS: Charlie Sears (317-535-4829), csears at doe dot state
dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot
iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state
dot in dot us. ADMISSION: $1.

>>> ANSWERS TO FREQUENTLY ASKED QUESTIONS <<<

Q: Who is this show for?
A: All Atarians.

Q: Does that include me? I have a ______ [FILL IN NAME] Atari
[CHOOSE ONE] computer / game machine / other product.

A: Yes.

Q: Can other people attend? For example, people interested in
buying state-of-the-art or antiquarian computer products from the
various vendors represented at the show?
A: Yes.

Q: Do I have to be an Atarian to attend the show?
A: No. Your dollar is as good as any other dollar.

Q: Are there other things to do in exciting Indianapolis while
I'm there for the MIST show?
A: You'd be surprised.

Q: Why am I seeing this message more than once?
A: Because there's more than one Atari newsgroup.

Q: Why is this message posted on all the Atari newsgroups?
A: Because it's an Atari show.

Q: But which newsgroup is it really appropriate for?
A: All of them.

Q: So why isn't it crossposted to all of them simultaneously?
A: In that case many people wouldn't see this message at all.
Filters commonly weed out messages with multiple crosspostings.

Q: Why is this the last show?
A: If everybody reading this shows up, maybe it won't be.

(This message posted independently by Erasmus at the eskimo hut.
Send flames to Erasmus, not to the show organizers.)

> Anyone interested? anyone want to write some music for it? :)

Ofcourse!!!! Hi I'm Marius Diepenhorst and I'm a student at the Rotterdams Conservatory (Netherlands; 4th grade). I wrote some ATARI 8bit music files (in .CMC format). I'd like to write some music for your game! Perhaps I should re-write the original music from Zoop? Or perhaps you like to hear a whole new composition (or more...)

Let me know; again I'd like to work at it!

Marius

189. John Harris' MAE11 on umich archive

In article <5pq84egvv1@nuke.csu.net>, kendrick@zippy.sonoma.edu (William Kendrick) writes:

>Let's have a vote. I'm wondering if I should leave the smaller TXT files >as TXT, and unARC any small TXT files that are ARCed (thus making it one >less step to get to the information), or should I ARC everything >(for faster download speeds).

My opinion, I guess it depends on how bad you need to free up storage space. With today's modems having good data compression, in the end it may not make that much difference in download time between the .TXT or .ARC file. With the different platforms having their own favorite compression programs, I would vote for the .TXT option.

Howdy !

I have now some different BASIC versions on disk but dunno how to use
them. If anyone has some info's about those Basics please E-Mail me:

- BASIC XL (OSS?)
- Microsoft Atari 800 Basic 1.0 (WOW! Bill Gate$ was here ;-))
- BASIC A+

They are quite useless if I have no documentations.

I would love to see some instruction manuals or at least some short
desciptions.

>
Sorry, but we do HAVE the MASTER DISK of ATARI DOS 2.5, not the NEW
one tthey made to replace 3.0.

It was supplied with Percom Double Density Disks and does have the
MENU option to switch density. ALL Percom compatible Double Density
drives suppoorted this software switching, ie, with MY-DOS, R-DOS,
SmartDos, etc..

We have every ATARI released DOS right from the 1.0 up to the 1450XLD
4.0 Master.

The original 2.5 DOS was shipped with Percom Masters after they used
OS/2 DOS from OSS.

Source record: 71828

Warning: Not for the humor-impaired. :-)
[stuff deleted]

My name is Dave Rhodes. In September 1988 my account was taken away, and System Administrators were hounding me like you wouldn't believe. I was logged off and all of my free accounts had been closed. The only escape I had from the pressure of failure was my computer and my modem. I longed to turn my advocation into my vocation.

This January 1989 my family and I had accounts at sites all over the world.

I am currently sysop of my own site on the West Coast of Florida, with a private spool, boat SLIP connections, and a beautiful gif of the bay. I will never have to crack again. Anyone can do the same.

In October 1988, I received a letter in e-mail telling me how I could gather 50,000 passwords or more whenever I wanted. If you believe that someday you deserve that lucky break that you have waited for all your life, simply follow the easy instructions below. Your dreams will come true.
Sincerely yours, Dave Rhodes

INSTRUCTIONS

Follow these instructions EXACTLY, and in 20 to 60 days you will have received well over 50,000 passwords, all yours.

1) Immediately e-mail your password to the first 5 (five) addresses below starting at number 1 through number 5. Enclose a note with each letter stating: "Please post my name to comp.security.unix"

2) Remove the name that appears number 1 on the list. Move the other 9 names up one position. Place your name, address, zip code, and e-mail address in the number 10 position.

3) Post the new letter with your name in the number 10 position into 10 (Ten) separate bulletin boards in the message base or to the file section, call the file, I.AM.AN.IDIOT.

4) Within 60 days you will receive over 50,000 passwords. Keep a copy of this file for yourself so that you can use it again and again whenever you need passwords, and so that the authorities will have hard evidence.

NOTE: Make sure you retain EVERY Name, Address, and password sent

to you, either on computer or hard copy, but do not discard
the
names and notes they send you. This is PROOF that you are
truely
providing a service and should the IRS or some other
Government
Agency question you, you can provide them with this proof!
That
way they know who else to go after...

1. Dave Rhodes
Florida State Penitentiary
imaloser@state.pen.florida.com

SERIOUSLY: They Postal Law they cite, call the ifnormation line,
makes this ILLEGAL. Through the mail, it's mail fraud, over the
phone, it becomes wire fraud.

Please note, make sure the poster has notified the IRS and his state
of his 'new' business and is paying the taxes on that $50,000.00 he's
making every 90 days....

Howdy !

I'm just learning 6502 assembler again. To do so I selected FTEs MAC65.
But I need some help. I'm not absolutely sure in using MAC65. The manual
is good, but there aren't any good and simple examples.

My questions:

How to assemble programs and start them within MAC65?
How can I produce executables files for use in DOS2.5?
Have you some beginner tips in using MAC65?
Are there any other macro libraries on FTP sites?

thx for any help!

[snipped]

> Have you used Atari BASIC (that which is part of the XL/XE
series? If so, BASIC XL is an extension of that. A very good one! I
believe manuals for BXL/BXE and MS BASIC are available at B&C
ComputerVisions http://www.myatari.com. MS BASIC is an early version of
BASIC used on the PCs. BASIC A+, I believe, is an extension of Atari
BASIC. You might want to check out

[more snipped]

BASIC A+ was the predecessor of BASIC XL which was in turn the predecessor
of BASIC XE. All were created by OSS (as was Atari BASIC) and are
backward-compatible with one another.

BASIC A+ was disk-based, and there was also a version of it for the Apple
II (the manual covered both versions). The biggest drawback of BASIC A+
was it's heavy RAM requirement--quite a bit less memory was available for
user programs than with its cartridge-based siblings.

Aside from being cartridge-based, BASIC XL added a few enhancements,
including a "fast mode" and better support for Player/Missile Graphics.

BASIC XE enhancements were mainly related to utilizing the extra memory of
the 130xe.

Both BASIC XL and BASIC XE are "supercartridges"--bank-select carts which
contain 16k of ROM, but fit in 8k of address space. It is practically
impossible to run these off a disk. (Some emulators can run them as ROM
images, though.)

OSS also created its own enhanced versions of Atari DOS (which it also wrote) for these products: OS/A+ for BASIC A+ (also for Apple II); DOS XL for BASIC XL; and DOS XE for BASIC XE. BASIC A+ pretty much requires OS/A+ to run. The others can run with just about any DOS.

MRB> (0) - zero key.. where can I get a replacement zero key?

Another 800? :-)

MRB> Also, how do I get the top off to see how much RAM is onboard?

It's difficult to explain, but here goes:

Under the cartridge bay lid are two tag, on at left, one at right. Push
those so they no onger hold the lid down. Now push the lid back slighty,
and tilt up. It should now come away. Refitting is reverse of removal.

Note that it isn't actually necessary to do that. Type PRINT FRE(0) at the
ready prompt, and you'll be presented with a number. Divide by 1024, to ge=
t
it in kilobytes, add 8k (for the bit that BASIC sucks up), plus a wee ibt
for DOS, if you're using it. Then basically, round to the nearest 16k. =
Chances are that you've got 48k of RAM anyhow.

206. Incorrect Screen Colour on 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-10 00:00:00 UTC
From: Barbara & Hal Akulick <akulickb@ntl.sympatico.ca>
Message-ID: <33C46C35.1F83@ntl.sympatico.ca>
Source record: 71915

After reading the postings in this news group for a little over a year I decided to get out my ATARI 130XE and start using it again. I have the 130XE with two 1050 drives. The machine boots from the floppy drives fine but, I am sure that the screen display is incorrect. The background is RED not BLUE. I was sure that it should be blue.

After reading through the manuals I was not able to find any setting that could be made to change the background colour. I had the machine hooked to the TV using the regular cable connection. I then made up a video cable and hooked it to the TV through the video input with the same results.

Is there something I can check internally to see if I have a component failure of some sort? I do not have the hardware service manuals for a 130XE and I know that the TV is working properly.

Any help you could offer would be appreciated.

By the way ... which DOS is used the most SPARTADOS or MYDOS?

Thanks
Hal

Hal,
SpartaDOS/MyDOS is a toss-up. I prefer SpartaDOS due to the fact it is very similar to MS-DOS in use/structure. In most cases it is compatible with other Atari DOSes. MyDOS on the other hand is a very extended version of AtariDOS 2.x. As such is completely compatible with everything Atari issued. Sparta seems to be a bit easier to use if you use MS-DOS and seems to be a bit more powerful.
Now for the video problem. On the 130XE, if you open the computer you will be able to change the color. Carefully, remove the metal shield, commect and power-up the computer, then locate a round control near the front left. Be careful with this control. It is a variable resistor and coule easily break off. This adjusts the color base frequency. I don't remember how much adjustment you have on this.
Hope this helps.

Peter,
Have you used Atari BASIC (that which is part of the XL/XE series? If so, BASIC XL is an extension of that. A very good one! I believe manuals for BXL/BXE and MS BASIC are available at B&C ComputerVisions http://www.myatari.com. MS BASIC is an early version of BASIC used on the PCs. BASIC A+, I believe, is an extension of Atari BASIC. You might want to check out gopher://gopher.archive.umich.edu:7055/11/atari/8bit for TurboBASIC XL. Another very good extension of Atari BASIC. The docs are included with the archive files.
There is an excellent book called "Your Atari Computer a Guide to the 400/800 (XL edition)" bu Lon Poole. This is like an Atari BASIC Bible. Loads of info, tutorials and demos. Another good one is Inside Atari BASIC from Atari. It's small, but good. I taught myself BASIC from that book back in 1982.

```
If you have OSS/ICD BASIC XL on disk, I WANT A COPY!!!!! I have the cart, but that's no
good on PC Xformer. There's no cart slot on the PC... Heh... The runtime of BXL is OK, but
to program, you need the complete language.

Near the GTIA chip you should find a Pot that adjusts the color tint
produced by the GTIA. Turn this until you get the correct screen
colors, of course your GTIA could be bad also.....but I doubt it.

213. Get ProTracker 1.5!!!

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-10 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5q37j0$6v0$3@nuke.csu.net>
Source record: 71922

I just got ProTracker 1.5 (by Profi/Madteam(?)) which was written this year.
It's an AWESOME MOD tracker..

In otherwords, it loads MODs (MODs, not MD8s! no conversion is needed!),
it plays MODs (they sound pretty damned good even on a POKEY, but there's
support for "COVOX", which I assume is some other sound chip you can
install on the Atari), and it even EDITS MODS!!!!!

You *need* upgraded RAM. I've began placing some MOD files (ones I know
work) on Umich. I'll keep them to a minimum, because MOD's are usually
big (up to 200+K! usually 30-100K from what I've seen), and since MOD's
are really platformless files.

For those who don't know exactly WHAT MOD's are, they're music files which
contained sampled sound. (They're like MIDI but cooler :))

They were originally made on the Amiga.

In basic just type ? fre(0)
If you get 37902 (or something like that, without dos loaded in, you
probably have 48K of ram), anything less, like 13300 or so, means you
hgave 16K of ram, and anything in the middle could mean 32K.

If you are checking for a ramdisk, (i.e. Axlon 128k ramdrive) you may need
to open in the 800 up..

Chris,
If the .BIN files are executable AND you are running APE or PC Xformer v3.60 (ones I know), simply rename the files to have an .EXE extension. Boot PCXf 3.60 with a DOS boot image as D1: and enter the .exe file as D2...D8:. This will boot the emulator with DOS and the exe file as the next drive.

Ex. C:\XFORMER\>xformer -j -s sd33-1.atr mybinfil.exe

Chris,
That depends on your application. XL-It doesn't do 130XE emulation, hense the XL in XL-It. So programs designed to run with the 130XE extra ram won't. Some programs with soung work better under XL-It. Your best bet is to get both and use the one that works best for the application. Also, don't forget about Rainbow. That's another choice in emulators.

Alan,
If it doesn't run, try a different DOS. SpartaDOS, MyDOS, or AtariDOS can make the
difference between running and not. Also 800, XL and 130XE mode could make a difference.

James,
I have heard that the SCSI version should work. I haven't tried it myself. The reason I suggested the ZIP is because the ZIP disks hold more, and are more stable in transport than the SQ-44s.
I have the Parallel ZIP on my PC and use it with PC Xformer. Works great! I want to try it with APE and my 130XE next.

Source record: 71843

I started this project about a year ago, now I want to finish it...

Has anyone reading this every played Omnitrend's Universe for the Atari 8-bit? Did any of your friends have it or play it? If anyone reading this has, or knows someone that has, could you please have them drop me a note?

I'm writing a web page on "classic" space games, everything from shoot-em-ups like Space War, to the play by mail games like Star Web, to "adventure" games like Universe and Elite.

The reason I want to know about Universe is to see if it predates Elite. Everyone's heard of Elite, but very few know of Universe. This is a shame!

If you're a reader of this forum, drop me a line here - if not, e-mail is OK (please, I get lots already though!).

Maury

Hello,

I am looking for the following system(s).

Atari 800, 800xl, and/or 1200xl.
Also disk drives for above.

I am and old Atari Enthusiast, and would like to replace a system that was thrown away many years ago.

Any system must be in working order, and must be in good condition. Please CC your reply to my regular mail address which is clauss@mail.oric.com.

Thanks!

Chris

Cross-posted to: pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

I've Added more stock to my Atari catalogs. So check it out.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM 804 Laser Printers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

I would just like to say thanks to all those who replied to my request on how to adjust the default background screen colour on my 130XE. I was able to get the proper settings.

Just so you know some suggested that I should disassemble the machine to make the adjustment and some said I would find an adjustment access hole on the bottom of the machine. Well I lucked out and there was indeed an access point on the bottom of the machine.

Its great to know that there is still a large user community for the machine I started out on and will now continue to use.

Thanks again !!
Hal

I don't think there was such a close relationship between DOS versions and
Basic versions. DOS XE was made for the XF-551 disk drive, but it wasn't
finished in time, so most 551s were shipped with Atari DOS 2.5. I think
DOS XL was sold with Happy disk drive upgrades, or you could buy it
separately.

Would it be possible to write a program for the PC that could play CMC sound?
It could use the POKEY emulator code used in XL-IT (and perghaps a few other
emulators). Perhaps, it could support other formats, and even music hacked
from games. This sort of thing has already been done with the Atari ST's
soundchip sound.

> There's a way round the BOOT ERROR. Turn on the drive after the Atari. There's not a lot of point, I know, but you'll get no boot error. :-)

(hmmm... does not the BOOT ERROR message appear if you have a disk without DOS in the drive? As opposed to having it just SPIN if there is no disk?... is not the boot error message actually on the DISK in a short boot code that just prints that message if DOS is not installed?)

Well... the OS does have a routine to read a sector (a user defined sector) (of 128 or 256 bytes). Not to manipulate files (DOS.SYS uses the OS code, modified in SpartaDOS for high speed, to read the sectors corresponding to the directory and VTOC to determine which sectors are free and which sectors are the starting sectors of files -- in Atari DOS and MYDOS -- a different structure in SpartaDOS) but to read in sectors. It is not hard to invoke (a short ML programme) to read in sectors from the drive. Compute! one time gave a short type in programme to save BASIC to the first few sectors on a disk (overwriting what was there) and another to read them back in. It was to be used if you booted without the drive and spent hours working on a programme and then realized you had no way to save it! It enabled saving on a blank disk and recovery after rebooting with DOS.

238. How to get access to some old "owner's manuals" ?

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-12 00:00:00 UTC
From: Laurent Delsarte <ladelsarte@skynet.be>
Message-ID: <33C7ACBB.6E7EE1F6@skynet.be>
Source record: 71858

I bought my very first 800xl (in France, Secam format) plus 1010 and 1050 drives back in 1984. Over the past few years, I felt a new interest in these machines and I started to buy some 2nd hand (hard to find "new" stuff anyway) peripherals and machines (800xl Pal, Touch tablet, 1050 drives, ...). The only trouble is that for many of the items I find, there are no "owner's manual". The content of these books is often really interesting. For some peripherals, there are superb colour glossy papers. I do miss these manuals. Does anybody know a ressource on the net where I could find electronic versions of these documents ?

Thanks in advance.
mailto:ladelsarte@skynet.be

239. Flight Simulator II image?

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-12 00:00:00 UTC
From: Fielding Mellish <f.mellish@bananas.com>
Message-ID: <01bc8ee6$548bc680$a5fe4ac2@fivvwrpw>
Source record: 71859

Hey all

Anyone know of a Flight Simulator II image I could use with an emulator?

I have the original disks (so please don't waste bandwidth with a useless flame war) but the .ATR image I made for use with the Rainbow emulator blanks out the screen after approx. 40 seconds of use.

The program knows its a copy because it only bothers to load up the Chicago area and the WW1 game (omitting New York, Seattle etc) and then must be setting up some kind of decrementing counter which blanks the screen after those precious 40 seconds. Interestingly, accessing the editor or pausing the game also pauses this counter indefinitely (or until you return to the game).

Seems like it would probably be a fairly easy job to discover the counter and NOP it out but to do that with ease you'd need a pop-up monitor of some sort and I don't have one!

Anyone have a working image? Or a scheme for removing the protection? Your ideas gratefully accepted...

Fielding

Has anyone played this RPG game for the Atari 8bit? I was very addicted to it on my 800XL a few years ago and I was wondering has anybody seen this in .XFD or .ATR form?

Yogi's site is inaccessible from myst.slcc.edu/~atari so I am at a lost where to find it.

Anybody??

difference between running and not. Also 800, XL and 130XE mode could make a difference.

I have noticed more items run under the Atari 800 emulation than any
other. Even though some of the titles were Xl/XE specific.. yet they
don't run under XE emulation but run fine under 800 emulation with
AtariOSB.ROMs... weird...

I have played Universe... those space-adventure games on the 8bit like Galactic Adventures, Quest for the Space Beagle, Universe, Jupiter Mission 1999, I don't know, I never had the patience to play those games, yet I loved to play Phantasie I and II and Alternate Reality, which is deep in depth games but tonnes of fun to play.

I have an original dos XE ver 1.00 (c) 1988 (Well it's actually been sold, just waiting for the money order)

My question is was there any other releases apart from Ver 1.00?? I mean it is a nice dos in principal, close to DOS 2.x menu driven, support for the Xf551 drive, but it is terribly slow and cumbersome, and it was a hog on RAM. (despite the name DOS XE, it ran on ANY 64k Atari XL/XE.)

I beleive the author of DOS XE was the same guy that worked for OSS and made other Atari DOS'

Supposedly DOS XE would support huge ramdisks and 16 MEG partitions, i.e. hard disk support, but this version doesn't do anything like that.

Except a 130XE ramdisk...

The BOOT ERROR message just takes a little longer if you have an unformatted
disk, no disk, or the drive door open. Looking at a Mydos disk with a
sector editor, I didn't see "BOOT ERROR" in the first three sectors. Of
course, disks formatted by Spartados have the "Error: No DOS" message.

Message-ID: <36f3df79.9780.7d69@raukamp.dame.de>
Source record: 71868

Hi together!

Here's teh first Atari 8Bit Games' Top5 list:

1. Alternate Reality / 8 votes
2. Star Raiders / 5 votes
3. M.U.L.E / 2 votes.
Rescue On Fractalus / 2 votes

The follwing are a lot of games with just 1 vote:

Protector II, BlueMax, Planetfall, Ballblazer, Bounty Bob Strikes Back, Pole Position, Rainbow Walker, DropZone, Akkanoid, Ghostbusters, ComputerWar, Gauntlet, PacMan, The Eternal Dagger, Mail Order Monsters, Temple Of Apshai Trilogy, Pooyan, Burried Bucks, Leaderboard Golf, International Karate, Silent Service, Atari Tennis, The Guild Of Thieves, Mercenary - Escape From Targ, Spindizzy

When more 8Bit-freaks take part, the list could be much better - although it's already interesting what people like, I think.
In the next list (if more people take part) I will make a difference between the 2 versions of Alternate Reality ... maybe then we have another picture.

So take the chance to take part :) Thanks :)

The list already reminds me of some of the games I have on disc but never played - I have to check them out ...

249. Atari 8bit Web & FTP Sites

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-12 00:00:00 UTC
From: tomhunt@bright.net
Message-ID: <199707122128.RAA09132@sparticus.bright.net>
Source record: 71869

Come visit the Closer To Home Web Page. Closer To Home, also known as CTH, has
long been associated with atari 8bit support. Many people will remember the old CTH dial
up bbs. It began in 1987, and remained in continious service until April 1997. It was ran
completely on Atari 8bit equipment. It does not exist any longer. It has been replaced by
the CTH web server and ftp server. These servers have been in operation since May of 1997.

The CTH web page offers a brief background of the history of Closer To Home
Enterprises. It also offers a Java chatroom, java 8bit message bases, tons of current
a8 links, and of course a link to the ftp server.

The CTH ftp server contains many mirrors. Most people don't know this, but the
"original" sites of which these are mirrors contain files which their composers downloaded
off of the old CTH dial up bbs. Yes, some of them spent DAYS downloading the files.
These files were uploaded to the CTH dial up by countless a8 users. So, they really aren't
anybody's mirrors. "They just are." If you missed out on the atari 8bit bbs scene, you
missed out on A LOT.

Even though the CTH web pages are java intensive, I am not insensitive to the needs
of lynx users. I spent years surfing the web with my a8, using one of the anonymous lynx
servers. If you are an Atari 8bit user with a modem, and have access to telnet, you can
try out one of these anonymous lynx servers to access the web:

sunsite 152.2.22.93 port 23
sailor 192.188.199.5 port 23

The best anonymous lynx server is Sailor. It allows you to download from any ftp
site, including the one at CTH, by using the kermit protocol. There used to be a site
that allowed you to uuencode and email files to your email account using the "P"rint function,

but I do not remember which one it is/was.

CTH is also offering FREE web space to anyone that wants to put up a web page that
features the atari 8bit in some way.

The URL for web browsers to access The Closer To Home Web Page is:
http://CloserToHome.dyn.ml.org . From there you can jump to any of the features. Also, if
anyone has bookmarked specific directories in the ftp site, they probably won't work anymore.
This is because I've restructured the directories. They best way to enter the ftp site is
from the link on the CTH web page.

Quote for today:

4. HACKER CONVENTION
5. SEMINARS
6. OTHER ACTIVITIES
7. GENERAL RULES AT THE SHOW
8. WHY SHOULD I ATTEND NAS?
9. HOW YOU CAN FIND OUT MORE
----------------------------------------------------------------------

Dear Atari friends,

It's once again time for the Nordic Atari Show, the annual get together
which has rapidly become a fixture for all Atari users.

Third time lucky, so they say, and as we arrange the show for the
third straight year we hope to fulfill everyone's expectations and that
this will result in the best possible atmosphere. We've gotten a certain
amount of criticism, both positive and negative, from those who have
attended the shows in '95 and '96. We've taken heed of the suggestions
made and we're once again off and running!

1 - WHEN AND WHERE?

This year the show will begin on Friday, June 13 and end on Sunday,
June 15. This is the weekend following the beginning of the summer school
holidays as well as the weekend prior to the Swedish Midsummer
celebrations. We'll open at 12 p.m. on Friday and close at 6 p.m. on
Sunday.
```

NAS97 will be held at a school called LUNDBY GYMNASIUM at HISINGEN, GOTHENBURG. Hisingen is a large island very close to the main parts of Gothenburg. There are a lot of local transportations there.

A map for the route description can be found at www.tripnet.se/sak/nas

GOING BY TRAIN
The train arrives at Centralstationen. Take tram 2 (destination Biskopsgarden) at Nordstaden and get off at the stop Rambergsvallen. Signs will lead your way to LUNDBY GYMNASIUM.

GOING BY BOAT
Boats arrive near the tram stop Masthuggstorget. Take tram 3, 4 or 9 to Brunnsparken, then change to tram 2 (destination Biskopsgarden) or 5 (destination Lansmansgarden) and stop at Rambergsvallen. Signs will lead your way.

GOING BY PLANE
Take the airport bus to Centralstationen. Follow the instructions as under "going by train".

GOING BY CAR
Please have a look at the map, LUNDBY GYMNASIUM is nearby a large road and should not be hard to find.

2 - WHAT WILL IT COST?

If you intend to attend all three days, you cheapest solution is the Three Day Pass otherwise a Single Entry ticket will do:

* Three Day Pass ... SEK 150:- (about UKP 12,75)
* Single Entry ..... SEK 80:-

These prices include full access to all the activities being held during NAS97.

3 - EXHIBITION

The exhibition hall is open:
Friday 12-18, Saturday 11-20 and Sunday 11-18.

At the exhibition you can see:

DISK1 (Sweden)
Will be showing Jaguar games and other fun stuff for Atari.

Daggskimmer/Tom Thomason (Sweden)
Bo Leuf and Tom Thomason will be demonstrating Papyrus, Interface and other shareware products. Tom will also be handling registrations for those.

Peter Segerdahl
One of the authors of Zero-X, the fantastic sample editing program, shows how to use Zero-X the best way.

Thorsten Butschke (Germany)
As last year, Thorsten is here and showing and taking registrations for

shareware products and the magazine Atari Computing.

16/32 systems (England)
Nic Harlow has always been at NAS, so why any different this year?
He's showing CD:s for Atari, games and more.

Line Audio
Roger J?nsson shows the different JAM products and more for the musican.

SAK and SAK/Skane
The Swedish Atari Users' Association and the local department in Skane are here too, to show different programs and computer systems in action. SAK will sell T-shirts, PD-disks, have a soldering corner and a swap meeting too for those who whises to sell, buy or trade single items of interest.

4 - HACKER CONVENTION

Demogroups and other programmers can gather for competitions and swap demos and all kinds of code. NoCrew is the Swedish demo group who will see to it that everybody takes part and enjoy themselves. Those of you hungry after rewards in the form of prizes will be well taken care of. Exactly WHAT prizes these will be hasn't been established, as yet.

These are the competitions:
Wild compo
Unlimited demo compo

More detailed information will be sent out to all demogroups by NoCrew. You can also make contact directly to them at their homepage at www.nocrew.pp.se

5 - SEMINARS

Last years seminars were very much appreciated, something of which we naturally have taken notice.

The SEMINARS will be held from 12 p.m. on Saturday and hopefully some of them even on Friday or Sunday. But - please attend on Saturday if you don't want to miss any of them.

- Peter Rottengatter
- About STiNG and Internet
Peter is the author of STiNG (the follow-up to STiK), and he will talk about installation and practical use of this program, plus some general talk about Internet and software for Atari.

- Martin Graiter
- Hardware seminar
Martin is a hardware specialist with long practical experience repairing and servicing Atari computers.

- Mille Babic
- HTML and Internet access

Mille will talk about HTML, and show how this cryptical language
really works. He also gives a lesson about going through the net,
practically, with you Atari.

- Claes Holmerup
- The hardware behind digital recording
Claes was here last year also, and talked about digital mastering.
Now he shows a bit more about all that hardware that's required
to make a digital recordning. Claes will also show how CD burning
can be done with an Atari computer.

- Rolf Johansson
- Layout with Calamus SL
What is Calamus SL, and how can one use it? Rolf shows how the
club magazine is done, special functions and regulars in
the software plus a bit about the new version SL96.

- Ulf Hogberg, Rolf Johansson and others
- General Atari Questions
We will also have a little "chat" seminar where you can ask questions
about everything - and we'll try to answer them. Maybe this also
can become some form of a debate, we don't know right now. Please
attend, as we might need you help.

6 - MORE ACTIVITIES

* Minor competitions such as "A-Z on the Keyboard" (a much appreciated
contest last year), hard disk throwing (this year it WILL happen!),
network games, juggling, etc. Everything depends on our finding
volunteers to act as game leaders and referees. There will be prizes
for the winners.

* A refreshment stand will sell non-alcoholic drinks, sweets, chips,
etc. We CAN arrange quantity discounts at the local pizzeria, and
will take orders for this.

* Internet cafe, with possibilities to surf on the Internet, chat,
telnet or whatever that is legal. The cafe will be nearby the
"normal" cafe, or refreshment stand as written above.

7 - GENERAL RULES AT THE SHOW

* No smoking inside the building or by windows and doors.

* No alcohol, beer or anything like drugs will be tolerated inside
the show. Please have fun with that outside in the city, but not
at NAS97. All such things found will be confiscated.

* Keep a good attitude against other people and show your tickets
to the staff if asked for it.

Anyone breaking these rules or acting violently will be thrown
out of the show.

8 - WHY SHOULD I ATTEND NAS?

The answer is simple: because you care about the TOS platform. We Atari owners are becoming fewer and fewer and a get-together like NAS is a simple way of seeing what's happening in the Atari world (no, it's not dead!) and meeting like-minded Atarians and hearing what kind of tips, ideas and visions they have.

9 - HOW CAN I FIND OUT MORE?

Information will be distributed regularly in the same way as this text file. In addition, we have a number of other sources of information where you can find out more about the show depending on your own resources.

* Our mailing list (e-mail). This will provide the very latest information to those on the list. To have yourself put on the list you MUST have an e-mail address. Send us a message on "nas-users-request@tripnet.se" with "subscribe nas-users" in the body of the text. Don't forget to include your e-mail address.

* Our home page on the World Wide Web. This has been in existence since last year and we'll try to update it as often as the information for the mailing list. The home page will contain more detailed information concerning times, schedule of events, directions on how to get there, competitions and housing.

The address is "www.tripnet.se/sak/nas".

* STraight BBS. This is the Swedish Atari Club's home BBS. Information concerning NAS will be included in the SAK menu. You can also use this BBS to ask any questions you may have. The telephone number is:
+46 31-336 39 73.

* Our club magazine, "AtariMagasinet", will contain adverts with more detailed information concerning NAS97 in issues 1/97 and 2/97. This is the largest mailshot we will send to our (SAK's) members.

* Our show co-ordinator is Rolf Johansson. He's supposed to know everything there is to know about NAS97. If you have questions to which you've been unable to get answers anywhere else you can send him a message at "rojo@tripnet.se" and you'll get your answers. If you wish to get into direct contact with him, he can be reached on his mobile phone on
+46 70-669 52 35.

KEEP THE TOS PLATFORM ALIVE.
WE ARE LOOKING FORWARD TO SEE YOU AT THE NORDIC ATARI SHOW 1997!

This group has far less spam than most.

Personally, I wouldn't favor strict moderation, especially in a newsgroup which only gets maybe 25 articles a day. Preferably, everything would be relevant, but as long as spam and flames with excessive personal insults or profanity were removed I'd be happy.

I used to despise services which censored their forums. In these days, with spam, flames and WebTV around, I'm rethinking my position a bit. Problem is, I doubt that an online service could carry enough traffic to justify carrying a group similar to c.s.a.8.

>
>Does colour artefacting work with that?
>Does Lode runner and Ultima come out in two colours?

Yes. The Mac AV hardware is designed to display conventional NTSC video in
a window and the 8-bits output conventional NTSC video. The only problem
is that the 800xl video seems to be somewhat oversaturated, so some
lighter colors come out almost white. I have noticed a similar problem
when the 800xl is hooked up to my composite monitor. Colors bleed
unpleasantly. My older 800 (R.I.P.) did not have this problem and looked
beautiful on the composite monitor. Haven't tried an 800 or other model
with the Mac, so I don't know if the colors would similarly be better.

>
>Well the SIO2PC cable will work with the Mac.At least if the Mac lets you
>use modems (I've heard that it doesn't even have a RS232 port).
>It's just a matter of software.

The Mac's ports are RS422, but are compatible with most RS232 devices.
Unfortunately, the SIO2PC cable is one of the exceptions since it is
design requires the RS232 ring detect line, which is not present on the
Mac's ports. Perhaps there is a way to modify the SIO2PC's design and
accomplish the same thing without using that line, but I don't understand
what it's used for. Perhaps it's not possible, I don't really know. Maybe
someone out there knows...

I am currently converting quite a big library of Atari 8-bit software to .ATR images. Since I've been on the 8-bit scene for quite a few years myself, I wouldn't mind sharing all this software with the rest of you fellow Atarians! :-)

If you are running a Web site with plenty of disk space, drop me a line if you are interested in putting the collection online.

It's about 250+ disks of which many are double density ones filled with file versions of many popular games, most good utilities....

In the years 1984-1990, I used to be quite active hacking on the 8-Bit together with a friend, using the handle of "CAKE"...

Greetz, ZB

P.S

If anyone has a cheap 1050 Drive in Good condition, please drop me a line, since I'd like to have one again. Right now I use an Atari 600XL with a borrowed 1050 Drive.... Would also be interested in a 1200XL if the price is reasonable....

Version 1.00 is the only version I know of ever released.

> I beleive the author of DOS XE was the same guy that worked for OSS and
> made other Atari DOS'

Yes, Bill Wilkinson (I THINK that was the name!), who wrote the original
Atari Basic, Basic XL, Basic XE, DOS XL, OS/A+, etc.

> Supposedly DOS XE would support huge ramdisks and 16 MEG partitions,
i.e.
> hard disk support, but this version doesn't do anything like that.

The original specification was for support of 16 meg partitions, but it
has been so long since I have even worked with it that I don't even
remember the actual size. I do know it doesn't even come close to the
original spec of allowing 8 meg file sizes, with 375,000 bytes being the
absolute maximum size allowed by the directory design.

> Except a 130XE ramdisk...

That I don't even want to speculate, I switched to SpartaDOS long before
doing my first XL memory upgrade.

Atari 2600 items/8-bit Auction #4B
---------------------------------------------------------------
Hi Everyone. Here is my listing and a few simple rules:
Bidders must supply full name, address, and phone number.
Otherwise, bids will not be accepted. I've had to many
people agree to buy an item and then pull-out.
Buyer pays post office shipping from Canada.
All prices in USD. Canadians can pay in equivalent $CDN.
I will keep you posted on the current high bid(s).
All items are in good working condition(unless noted)
but sold AS IS.

Auction ends 11:59 PM CST July 31st, 1997.

NOTE: Please bid on individual items, no bulk bids.

Thanks.

270. $$ NEW SYSTEM, BETTER THAN "ADD ME TO YOUR MAILING LIST" $

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-13 00:00:00 UTC
From: a7@a.a
Message-ID: <33c92256.0@news.unibe.ch>
Source record: 71790

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to work. This

system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name

: tons of current a8 links, and of course a link to the ftp server.

<sarcasm mode>

Tom... are you implying there's an Atari 8-bit web browser capable of Java? :)

Oh of course you aren't. :) There isn't even an Atari 8-bit web browser
PERIOD.

So... are you implying that there's a terminal-based web browser, like Lynx,
but capable of Java?

Hmmm.. I didn't think so.

<end sarcasm mode>

Tom - WHY did you pick Java!? <:^((BTW, I admit, although most of my
complaint is because 8-bitters with dialup accounts won't be able to access
any Java-based information, a good chunk of my complaint is just a personal
dislike for Java on the web ;))

Tom continued:

: Even though the CTH web pages are java intensive, I am not
: insensitive to the needs of lynx users. I spent years surfing the web
: with my a8, using one of the anonymous lynx servers. If you are an Atari
: 8bit user with a modem, and have access to telnet, you can try out one of
: these anonymous lynx servers to access the web:

<snip>

Well, yeah cool... but still!! What if I want to chat through Lynx? :(

(pst, btw, I happen to have a great Lynx-compatible chat room program
available for free for Unix webservers ;))

Anyway... don't take me too seriously... obviously I don't have too much of
a right to whine, since my Atari material on the web is a grain of sand
compared to yours. (and, unfortunately, I don't even have a modem on my
8-bit.. but hey, my PC can't run Netscape, so I'm still stuck with Lynx,
even if it's not on an Atari! ;))

Maybe I just _hate_ java and don't know it yet. ;)

I just checked my R-Time8 to see what it would do at 12-31-1999
23:59:59. It turns over to 01-01-00 00:00:01. This is NOT good, but not
a major deal for the 8-bits. Does anyone know of a replacement for the
R-Time8 that supports 4-digit year?

I got bored so I thought I'd repost something silly :-)

Isn't emulation kind of like messing with the spirits from your long-dead computer??

Dead because you poured soap in the cartridge slot to wash out the proliferating ant farm. Dead because you used it as a pulltoy for your kid sister?? Dead because we put more power into it hoping to get faster graphics?

In spirit because you have to sit infront of the SEE prompt and type in the summoning codes. And we KNOW its ghostly because its here and yet a flip of your power switch and its gone. Nowhere to be found. Not even its corporeal shell exists.

Isn't it against your religion to summon demons like this? Might there be a hidden price. I mean isn't this re-incarnation in its truest form? You have a old and dead computer, An Atari-400 for example. Its shell is rotted and decayed and keys are all gummed up. Water corrosion has attacked the pcb pretty bad. I'd call it dead..

With emulation you have somehow taken the very essence and lifeblood of that machine and transported it into a new shell. One that's superior in every respect. You've given LIFE to something from yanked from the grave. Isn't that a little voodoo-istic? might it be best if we left the deceased alone? What happens when it goes sour? Trifiling with something we don't understand might be dangerous. With a hidden price tag which might be too high.

Our emu programmers are the priests and popes. We must follow their scripture. With only the original designers achieving Godhood; we follow.. Today's Reading is From the Book of AtariXL.rom Version 2.5, option -oldmode. Section 4, Games_1.ATR .. ..

Jack Follansbee (jack@threeindians.com) wrote:

: Bill,

: Why don't you post your ideas here and see what comes of them, hmmm?

Alright... something like Mega Man. A platformish game with lots of
neat weapons.

Something like Doom / Maze of Agdagon... esp. if it supported multiplayer
like MoA does. :) (See my upcoming post on Game Link II)

Perhaps a nice fast fighting game... use character graphics for the
fighters... perhaps do it kind of Street Fighter II - ish... very large
cartoonish guys... simple graphics, lots of fast action to make up for it.

Somebody'd need to do the art, of course... and we'd need to figure out
how to make up for a lack of firebuttons. But hey, there were a number
of very good karate games for the Atari... (I just don't find them
intense enough, I guess :))

Ummm.. what else have I been thinking of... Perhaps something like
Slime World, that old multiplayer Lynx game. Kind of mazish, but still
a side-scroller. Multiplayer using Game Link II or something similar.
(Can you tell I'm on a multiplayer kick here? :))

On a simpler note, I had an idea for a game where you're an alien in a UFO.
You'd go through different levels, each with a different task and slightly
different game play. (Collect Cows, Harrass Humans, etc. :) Kind of
teenage pranks, but they're aliens.. I think I got this idea from that
explanation of "Teasers" from Hitchiker's Guide To The Galaxy ;))

Oh... and Star Raiders III. (And IV.. and V.. and VI... I imagine a
series of different but very story-related games, kind of like all of those
Star Wars games Lucas Arts put out... for example, a Zylon Training
game where you play a Zylon instead of an Atarian. >:^))

Those are some of my ideas (the ones I can remember right now :))

Anyone with good coding skills want to help actually IMPLEMENT them?
(Man, I feel such a loser having to ask... but I guess the Atari's just
too restricted of a machine for me to handle... or maybe it's just I need
to learn 6502 :))

Thanks!

Message-ID: <5qerth$o8a@nntp02.primenet.com>
Source record: 71726

The mortal MSmith wrote:
: While reading a recent copy of the 8 Bit FAQ's, I noticed that it skips
: right over the Carina software, making a vague reference to it. I know
: that the Shadow supports this software, but is there a technical
: dissemination posted anywhere. I would like to know it's features and
: what hardware it supports.

: I am very interetsted in restarting my BBS, and would like to use the best
: available software.

I want you to listen to me and listen well.

Shadow (David Hunt) does _not_ support Carina. He simply keeps it frozen in a time warp and spouts a lot of rhetoric. I am certain he is either totally inept or has a mental problem, probably the latter.

Whatever he says about its current and future features, do not accept unless verified. Any evidence you bring to his attention that his claims are untrue will be scoffed at in favor of various lame excuses (pilot error, mystery testimonials, etc..)

Carina hasn't really evolved a heck of a lot since he bought the package.

Compared to BBS Express PRO! (or even Forem XEPRO) it has the following limitations which grow ever more severe as we approach the year 2000:

1) No support for color PC-ANSI.

2) Although it will support high speed connects, actual real-world throughput maxes out at 2400-baud uncompressed levels. Those who attempt to Run Carina at high speed on a Black Box will bang hard against the hardware flow control and most likely lose characters during file transfers. Plus, the data compression may wreak havoc during file transfers, especially if you run without hardware flow control. There is absolutely zero advantage in using a high speed modem with Carina at this point--it's more of a liability than an asset. Using high speed screen handlers don't seem to improve matters any. The bottleneck is due to the quality of the ML core and the reliance on too much BASIC vs. ML.

3) It's modules are something like 17K in size. Atari Basic is the language it uses. Basic XL should work with it but Basic XE's expanded environment is incompatible. This means that user-written modules have to be pretty slow. Basic XL doesn't really speed up operations any. Turbo doesn't matter.

4) The file transfer protocols are minimal. I don't even think it supports Y-batch, at least not for upload.

Need I go on?

Shadow had a lot of things planned for Carina 3 which was already overdue when I was waiting for it over 4 years ago. He had Tom Hunt (probably one of the best, last 8-bit programmers around) who was ready to rewrite the M/L core but Shadow freaked out and never gave Tom the source code and never really followed up on directing Tom on how to proceed.

The idea for a BBS based on a BASIC core is a sound one, a paradigm which was much better supported by Forem XEPro, a BBS with a clunkier interface but better high speed support and better features. Since Forem was built around the much more advanced and bigger Basic XE, larger and more powerful code could be generated, even by the novice. This helped Forem be a snappy BBS because it had far fewer module loads than Carina or BBS Express PRO! (which used its minicomputer-like overlays to stay within the 65K LCD memory footprint). The only problem with Forem was that since it was a program cobbled together by several authors over time and free, it was never very easy to set up and not easy to understand its inner-workings. Included documentation left much to be desired, but I still think it was giving Pro! a run for its money when I was still 8-bit-BBSing, especially when the PRO/Forem networking bridge became a reality. Forem still had plenty of potential left in it.

The single greatest part about Carina was its command line interface. That interface was a work of art! But everything else was a mess.

The only programming Shadow accomplished during my stint as a Carina sysop was the PCPursuit (Rest In Peace) networking software which still cost me a bundle to beta test with him over the phone. However, when it worked, it was pretty neat.

Source record: 71728

Basic XL is a fantastic language. Leagues above AtariBasic in features and due to banked ROM, not really any larger a footprint.

Basic XE with the extensions are even greater if you have expanded RAM.

If you must use AtariBasic, you should make sure you have a Revision C chip inside. Most XLs have Revision B (B for buggy).

I still think that a good novice program for the Atari 8-bit would be to clone Atari 2600 Adventure and then go on to make sequels based on the same engine. 64K and the additional throughput of the Atari8 should be able to provide a much more expansive environment.

It would be much easier to write this on an Atari 8 than a 2600 but it _should_ be possible to get the graphics emulated 1:1 on an 8-bit Atari.

That was one of the last things I was talking to Bill about (I think) when I left the Atari8 scene and I still think it is worth doing.

BTW, the source to Adventure (or at least a well commented disassembly) is floating around so the hows and whys of how it handles its real-time environment are no longer a secret.

A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a scam," but like most of us I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and addresses stated in the article. You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it. I figured what have I got to lose except 5 stamps and $5.00, right?

Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with my country Post Office, and others had with US Post (1-800-725-2161) and they confirmed that it is indeed legal!

Then I invested the measly $5.00.............

Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had made a total of over $1,000.00!!!!!! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in ....

It's certainly worth $5.00, and 5 stamps, I spent more than that on the lottery!! Let me tell you how this works and most importantly, Why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses: (MAKE SURE YOU MAIL $1 cash to EACH of these people or it WILL NOT WORK.....If you follow these directions carefully......you willl recieve LOTS of money....if you don't follow the directions...you will no recieve jack.
YOU CAN USE A FAKE NAME FOR PRIVACY AND SECURITY REASONS....AND/OR RENT A P.O BOX AT YOUR POST OFFICE OR A MAIL SERVICE CENTER IF YOU DO NOT WANT ALL THIS CASH COMING TO YOUR HOUSE......BUT IT IS PERFECTLY FINE TO USE YOUR HOME ADDRESS.....MOST DO.

#1 Chad Sprague
1116 E. Hobson
Sapulpa, OK 74066

#2 TB
4093-A Hollenden Dr.
Raleigh, NC 27616

#3 K Grubbs
7130 Ducketts Ln #304
Elkridge, MD 21075

#4 R Smith
1961 Peach St.
St. Peters, MO 63376

#5 TR
10 Hillside Circle #1
Logan, UT 84321

STEP 2: Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 25,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following: (OR YOU MAY BE ABLE TO USE THE "COPY AND PASTE" METHOD.)
FOR NETSCAPE USERS:
1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)
4) When your're done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE

UNTIL YOU SAVE IT. (so you don't have to type this 200 times)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right, you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!
REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now

those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. And start posting again. The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $5.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY
and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k.

This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!!

Don't listen to the people that don't trust it and continue to say
it's illegal and don't work... They are just too skeptical.

283. Carina BBS Software. Where ?

While reading a recent copy of the 8 Bit FAQ's, I noticed that it skips right over the Carina software, making a vague reference to it. I know that the Shadow supports this software, but is there a technical dissemination posted anywhere. I would like to know it's features and what hardware it supports.

I am very interetsted in restarting my BBS, and would like to use the best available software.

Thanks,
Mark Smith

The BOOT ERROR message is contained within the Atari OS. If the OS
detects a drive configured as drive 1 is present, it tries to boot it. If
they boot fails displays the BOOT ERROR message and keeps trying.

If it fails to detect a drive at all it just goes on with its
business, heading to basic, self-test, etc.

Laurent,
Believe it or not, the owners ,anuals were basicly just info on how to connect them together, and not much else. I'd recommend looking for other sources of info. There should be a list of books in the Atari FAQ. Stuff like: Inside Atari BASIC, De Re Atari, Atari Reference Manuals, Mapping The Atari, Your Atari Computer, a guide to the 400/800 (XL/XE edition), etc.
Most of these are available at B&C Computervisions, California, US (http://www.myatari.com).

Keatah,
Actually... NO! I have a fully functional 130XE at home. I use PC Xformer at work as a extension of the 130XE. Granted, it's not perfect, but it works pretty well. All I'm missing is the cart slot for my BASIC XE and SpartaDOS X carts. This majes good use of an otherwise poorly designed OS---Windows/MS-DOS.

LONG LIVE THE ATARI 8-BIT COMPUTERS!!!!!!!!!!!!!!!!

Just change the .TXT extenders to the Atari standard, .ATA
for Atascii, and .ASC for ascii, and you should be fine.
That way everyone will know which ones are easily readable
on any given machine. Please do separate the descriptions,
so people will have more to go on than just a filename.
Even some sort of index file would be nice, a single file
with descriptions for each file available.

I am looking to buy sega genesis games, n64, snes, nintendo, and all systems. email me want you want to sell.

N64 games only 35.00 each.
Mario 64

Sega genesis games only 10.00 each.
NHL hockey
Turion defender
Joe mtna ftbll 93
Altered Beast
madden 94
wrestle mania
buster douglas boxing
sports talk baseball
stargate
cyberball
Forgotten Worlds
wrestle Mania
Jeopardy Sports Edition
Altered Beast

Sega CD games only 10.00 each!!
cliff hanger
eternal chamions
demolition man
racing aces
terminator
Dracula
Robo Aleste
Surgical Strike
Rage in the cage
power rangers

Snes games only10.00 each.
shaq fu
Fighter's History
Madden 94

Nintendo games only 5.00 each.
ninja turtles 2
millans secret castle
smash tv
super mario 2
operation wolf
mario

mario
Low g man
mafia conspiricy
shatter hand
Hoops
mario
festers quest
mario
mario
mario
football
alien syndrom
ninja turtles
solar jetman
mario

Game Gear only 30 dollars!!

Go to http://users.cyberzone.net/cadams to see a full list of games
and much much more. Like tournaments, reviews, and great prices!!

299. School Research Paper

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-14 00:00:00 UTC
From: gb899@cleveland.Freenet.Edu
Message-ID: <5qcrqc$a7u@alexander.INS.CWRU.Edu>
Source record: 71813

Hello. I need some input from as many of you people as possible.
I am working on a research paper for an Information Systems
Concepts class. This paper makes up half of my grade for the
quarter.
The topic I have chosen to research is Untapped Markets in the
Programming Industry, with an emphasis on retro-gaming and classic
computing. What I need from you readers are your thoughts and
suggestions on the following questions:

For classic video game systems such as the Atari 2600/5200/7800,
Intellivision, Colecovicion/Adam, and any others...

1: What types of games would you like to see produced for these
systems?

2: Do you feel there is a niche for a hand-held video game unit
that would play collections of the classics compiled onto small
cartridges?

3: How much would you be willing to pay for new cartridges for
classic systems or for the above hypothetical hand-held system
and its respective cartridges?

For classic computers such as the VIC-20, C=64/128, Atari (8-bit/ST),
Apple II series, etc...

1: What kinds of new games would you like to see developed?

2: What would you like to see in terms of new applications, system
software, internet/telecommunications tools, programming tools,
or any other items you can think of?

3: What price range would you consider to be reasonable for quality
games, tools, and applications?

4: What form of distribution/registration would you feel to be the
most effective for new packages?

a: Full Commercial (pay before play)
b: Traditional Shareware (try first, then send in your registration)
c: Commissionware (my own term... like shareware, only after you
pay the registration, you get a copy of the
program with your own unique registration number.
Then, any copies you distribute that have your
number on them will earn you a commission if the
person you gave the copu to registers)

5: What new hardware would you like to see produced for the various classic systems?

Finally, for statistical purposes, I would like to know what systems, both classic video game and classic computer systems, you use on a regular basis and which ones you would like to see supported.

Thank-you very much in advance for your participation and for your time...

I agree with the other comments that the problem is still relatively small in
this low-traffic newsgroup.

Another practical reason: it takes at least 100 YES votes to push such a change through the system, a number I think comp.sys.atari.8bit would have trouble coming up with even if agreement was unanimous among us.

> Galactic Adventures, Quest for the Space Beagle, Universe, Jupiter Mission
> 1999

Well the first (Universe) is supposed to be a lot more in depth than the others you mention, although the other two are much more graphical if I remember correctly (actually, as I remember it Jupiter Mission was actually a collection of games strung together one after the other).

Universe is the one I'm interested in, because like Elite it was much more open ended that most other games - the game ended when you did xxx, but to get there you had a lot of different things you could do. It also came out at about the same time as Elite, and that's another interesting question - which came first?

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

Alan,
I don't remember it supporting those, but it is suppose to support the DSDD (360K) format. I personally use and prefer SpartaDOS for most applications. It's easy to use, is small, supports the 16MB hard drive partitions and ram disks. It seem to be very stable (v 3.2 and SDX) and is very similar in structure to MS-DOS. If you cab get your hands on a copy (SDX cart. recommended), by all means grab it!

All,
I'm no ML programmer, but love BASIC XE. Could someone fine a way to rewrite BASIC XE for use with the emulators? I'm sure I'm not the only one that would want it. Another is SpartaDOS X, again, usable under emulators. SD 3.3 works, but I miss some of the features of X.

Here's one,a database (X base compatible) something like Fox Pro for DOS 2.6, with a nice report generator and queries. I suppose it would have to be built for the 130XE, but what the heck.
Some sort of telecom that updates Bobterm.
A graphics conversion system to convert to/from all atari modes, IFF, GIF89, BMP, ect. JPEG may be difficult, but if possible...

Well, that's a few of my interests.

At Goodwill today, we picked up what appears to be an Atari compatible hard drive. One half of the unit is occupied by a regular floppy drive, but the other half looks just the right size to contain a hard disk (I don't really want to open it up and look inside). On the back there are the standard Atari SIO connectors as well as a little card with a chip on it sticking out. The card has what looks like a card-edge connector for a hard drive as well as another connector that looks like the type used to connect an MS-DOS drive to an IBM PC.

The label on the rear says AT-88 S1-PD, and the name plate on the front says Percom Data.

We paid $3.00 for this and would like to find more info on it.

Is this actually a hard drive or is it just another floppy drive?

If it is a hard drive, how do I access it to see what data and programs may still be on it?

Thanx

> or any other items you can think of?

Fans of these computers are already filling the required niches by personal
effort. I doubt any profit based venture could add anything at all to
any of these platforms, with the exception of the Atari ST.

> 3: What price range would you consider to be reasonable for quality

314. How do I program for GameLink 2?

Ok, I've asked this a dozen times and nobody seems to know right off..

So, I'll post a snippet of the docs to building one (from "GAMELNK2.DOC"
inside the Maze of Agdagon ARC, "agdav1c.arc", found at
http://umich.edu/~archive/atari/8bit/Games/Action/agdav1c.arc)

BTW, for those who don't know, Game Link 2 is a piece of cabling that
allows you to connect 2 or more (up to 8?) Atari 8-bits together.
A small number of games were created for this system, and I'd like to
see (and write) more!

Here's the info. Hopefully one of you can figure out what I need to do
to talk back and forth with a cable like this:

B) Temporary GameLink-II SIO Connections (2 nodes):

Realizing that users might want to try "Maze of AGDAgon" and the
GameLink II system before committing to building or buying a more
permanent connection, we offer the following directions. Follow
these for a quick, temporary method to connect two Atari 8-bit
computers together.

1) Scrounge up two or three paper clips (the smaller size) and a
rubber band.

2) Bend and cut the clips into the following shapes with the
dimensions shown below. Make sure the cut ends do not have any
burrs, as these could damage your SIO cables.

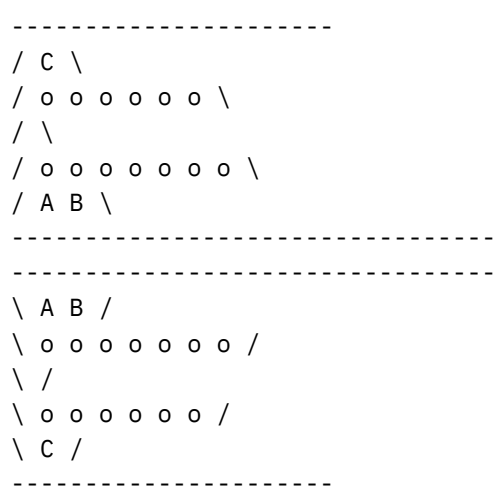
```
<--5/8"--> <--5/8"--> <---7/8"--->
---------- ---------- ------------
^ | | | | | | ^
| | | | | | | |
1/2" | | | | | | |
| | | | | | | 3/4"
v | | | | | | |
"A" "B" | "C" | |
| | v
```

3) Boot up the Host computer, load the AGDAgon.COM file, and
disconnect the serial cable from the disk drive. The other end
of the serial cable should still be connected to your Atari.

4) Get the other Atari ready (monitor or TV connected and turned
on, serial cable plugged in).

5) Take the free ends of the serial cables, and wrap the rubber
band around the two connectors, so that the free ends face you

like the diagram below:



6) Now take the first of the two smaller clips you made and gently push it into both pins marked "A" above. If you feel great resistance, do not try to force the pins in, as you may damage the connectors on your serial cable. Since the clips you have made are narrower than the standard Atari pins, they should not cause damage if inserted correctly. Be careful not to accidentally short together any other pins.

7) Take the second of the two smaller clips and push it into the pins marked "B" above. Try to push the two pins in an equal amount. It doesn't matter if the two clips touch each other.

8) Take the remaining (longer) clip you made and push it into the pins marked "C" above. Be careful not to short it against any other pins. The third clip was intentionally made longer so that it won't be touching the other two clips when installed correctly.

9) Place this assembly carefully on a table top and out of the way (don't leave it dangling from the two computers).

<snip>

C) GameLink-II SIO Connections (2 or 3 nodes):

The following directions give you some insight into how the GameLink II system works, and will allow you to create a more permanent connection for two or three player games. They are provided for the more technical user who has sufficient experience to assemble a small hardware project. Non-technical users who wish to buy a multi-node connection should skip to the next section.

1) The easiest way to construct a GameLink-II cable is to purchase a long (6 foot) SIO cable and cut it in half.

2) If more length is needed, the wires can be extended to around 6 feet per node (thus, from one computer to any other would be a maximum of 12 feet).

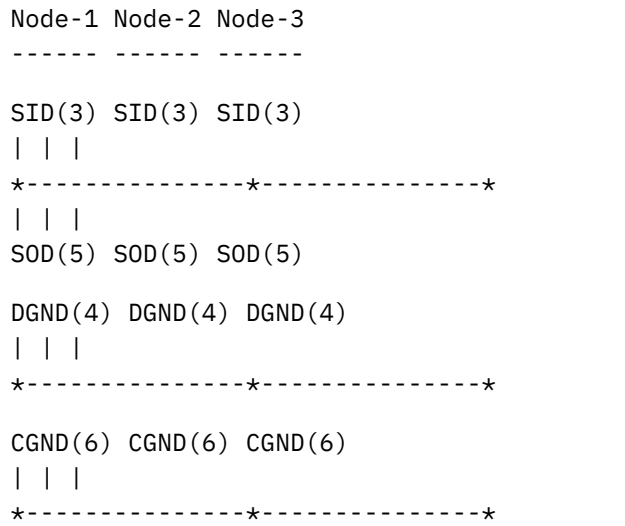
3) The connections are made according to the following list:

pin	name	connection	description
1	SCLK	not used	leave with no connection
2	OCLK	not used	leave with no connection
3	SID	PARALLEL	connected to all other SID & SOD
4	DGND	PARALLEL	connected to all other DGNDs
5	SOD	PARALLEL	connected to all other SID & SOD
6	CGND	PARALLEL	connected to all other CGNDs
7	COMMAND	not used	leave with no connection
8	MOTCTL	not used	leave with no connection
9	PROCEED	not used	leave with no connection
10	+5V	not used	leave with no connection
11	AUDIO IN	not used	leave with no connection
12	+12V/NC	not used	leave with no connection
13	INTERRUPT	not used	leave with no connection

4) Both grounds are connected between all systems.

5) Both the SID (Serial Input), and SOD (Serial Output) lines are connected together from all nodes. This allows any node to transmit data to all other nodes (including itself, if desired).

6) A graphical representation of a 3 node GameLink-II network is shown below, with wires indicated by dashes (-) and vertical bars (|). Junctions shown by asterisks (*)



7) Another method would be to buy SIO sockets, and mount them in a box, or PC board, and connect them as above. This would allow you to use unmodified SIO cables.

So, anyone out there (including Jeff Potter, who I believe was one of the designers of this system) want to help out!?

Thanks!!!

: I still think that a good novice program for the Atari 8-bit would be to
: clone Atari 2600 Adventure and then go on to make sequels based on the
: same engine. 64K and the additional throughput of the Atari8 should be
: able to provide a much more expansive environment.

Hey! I remember that. I even found an old GIF that I had on my website
for "Adventure XL!" I wonder if I have the code anywhere.

Did I actually START coding it, I wonder? I remember I planned it.
I wanted to do all PMG for the baddies. AXL would have the same flickery
problem that Adv. had when you get too much stuff on the screen. I
figured I'd code it as a VBI...

Wow... the thought of annoying people with that bat is kinda cool. Hehehe..
whoever decided to add that bat to that game, and make it do what it did...
MAN, they were evil.. hehehe.. cool!

Hey, didn't someone start making an actual PORT of Adventure on the 8bit?
I SEEM to remember having a copy of it(!)... I remember it was pretty
accurate, but like 2+ times slower than the 2600 for some reason...

hmmm

If my memory serves me correct, that is the same type of drive that
I had. (I took mine to goodwill also).

Anyway, it is just a regular floppy drive, but it is true double
density and therefore can get 192K (I think) per disk.

The card on the back is a parallel printer port.

Considering it costs about $500 brand new (back in the day), $3.00
is a good bargain.

Hi

Jeff Potter is the President of our local Atari user group here in Orlando FL,
We had our last meeting yesterday and I spoke to him about his game Maze of Agdagon, After playing it with him for a while in network mode with just 2 XL, I asked him if there was any room left in the core for upgraded graphics and his reply was YES!!! This can be a Doom like game, will good wallpaper added and some weapons that swing while walking. Ill send you his Internet address tomorrow. Ill also be meeting with him next month. He brought a network Box that had 4 SIO ports for hookup of 4 8bits, the best part about this Network Box is that inside it sits only 1 CHIP!!! The whole network Box,chip, and SIO ports would only cost a few dollars. The Speed was great too.. Just as fast as playing DOOM with friends all with Pentiums. Potter has some good code there and outstanding networking box.

We also need a NEW PINBALL game!!!!!!!! Im sick of Pinball Construction
Set
Mode 8 stuff, I have a Lot of Pinball games on the clone that can be
ported
over to the 8bit.

Look at the Flipper Demo! Looks good huh? I just wish I could play it
:)

Star Raiders III IV V Yes !! Yes !! You guys can do it thats for
sure,

Other Ideas

Draconus II
Zybex II
Rockman II
Joust II with Zybex like graphics :) and cool MPT/CMC sounds

And what about a New Flight Simulator - Im also tired of FSII

I was playing the other day VECTORMAN on the Sega, Its just a man made
from BOBS!! scroller with kool weapons, would be killer on the 8bit..
Call it BOBman!

But I realy need a HQ Pinball game BAD!!! for 8bit Atari!

hi guys... a dream came true when i connected a sio2pc-interface
to the modem port of my atari st...

with the software called "800xldj", a virtuell drive-emulator, you can
"connect" 8 drives to an real xl like with ape, if i am right... i
dont have a pc...

the software is fully gem-konform and falcon-compatible and supports
many features which i can not explain right now... i will put some
infos on my webpage soon...(next week)... just short notes:

1. booting the xl from st-harddisk
2. access of the harddisk-directory even via dos 2.5!!!
3. up to 8 virtuell drives
4. disk-changes by simple-mousclicks
5. dynamic disk-images... format it in single, it will be single file,
format it quad... it will be quad... ;) and the format is packed... so
just used sectors are safed...comments possible to each disk, shown when
loaded into dj...
6. forbidden writing on st media by xl... for securance...
and many more...

i dont know how i could work without such a tool for so long...

bye, heaven/taquart

Well tell us the full filename!
There's really no mystery,COM or OBJ are programmes.BAS is a
BASIC programme.DCM is a diskcomm file.EXE is a IBM PC programme.

Tell me the exact address you used to get to "UMICH",and I'll look for my self.
Did you FTP or Gopher the file?
Remember never to use "D" in Gopher to download a file
(unless it's a text file),just press RETURN to download the file.If RETURN just
views the file,then you're only meant to view that file,and downloading
a binary file that isn't meant to be downloaded will just result in a corupted
file.

Remember that unlike IBMs,the Atari actually checks to see if the file is a
binary load file,so there's no chance of acidentily loading a BASIC or IBM
programme and crashing the Atari.BASIC also does a similar,if imperfect,test.

I used to always complain when people would put up non-computer text files and
ZIP them.I mean I understand ZIPing the docs for a PC games,but if it's a BBS
game or has nothing to do with computers,then you cut out people who don't have
PCs.(though Amiga and ST now have ZIP capability)
You're only hope is to re-upload the file to your Internet UNIX host,and that
they have the Info-ZIP programme.
Of course many FTP servers support ZIPing and un-ZIPing of files when you
download them.
You might also ask your IUH to provide a arc programme for you.

>I bought my very first 800xl (in France, Secam format) plus 1010 and

I don't know how SECAM differs from PAL and NTSC,but some programmes are affected by these differences.You might look into getting a PAL TV and Atari so that you can use the latest German(Deutche) and UK software.
But I've been told that PAL doesn't allow colour in GR.8 (320x192) mode,so a NTSC TV would also be needed to play games like Ultima and Lode Runner, unless SECAM DOES give you colour in GR.8.
(GR.0 (regular text mode) also gives you this "colour artefacting" as well but the character set has been designed especially to prevent this)
Like I said,I know nothing about SECAM.You could go into BASIC and try:

```
GRAPHICS 8
SETCOLOR 2,0,0
COLOR 1
DRAWTO 0,160
```

You should see a line made up of two colours if SECAM supports colour artefacting.Note that BASIC spells "colour" as "color".

>1050 drives back in 1984. Over the past few years, I felt a new
>interest in these machines and I started to buy some 2nd hand (hard

>these books is often really interesting. For some peripherals,
>there are superb colour glossy papers. I do miss these manuals.
>Does anybody know a ressource on the net where I could find
>electronic versions of these documents ?

Well we could tell you most of what you want to know.
I don't know what advantages the 1010 drive gives,but a 1050 gives you 50% more space (1040 sectors versus 720).
You need DOS 2.5 to take advantage of this,since DOS 2.0 only allows you to use 719 sectors.(that's right,sector#720 gets wasted)
But DOS 2.5 has the same limitations as DOS 2.0,in that the highest sector# that can be used is 1024.(DOS 2.0 arbitrarily limits you to 720 sectors)
So sectors 1025-1040 get wasted,as well as #720.And sector #1024 is used to keep track of the extra sectors past #720.

I'd advise MYDOS,since it can use any number of sectors.Where as DOS 2.5 has one format for 720-sector disks and another for 1040-sector disks,MYDOS has the same format for 720-sector disks (for compatibility),and another for everything else.(I'm not sure which it uses for RAMdisks,which usualy have LESS than 720)
It doesn't support the DOS 2.5 1040 (really 1024) sector format,though I'm

sure it could still read them.
(but writing out to a DOS 2.5 1024-sector disk with MYDOS would be BAD,since MYDOS doesn't understand the hack used to get the extra sectors past #720)

DOS 2.5 is really a dirty hack.Of course so is MYDOS,but MYDOS's hack allows access to 65535 sectors where as Atari's hack doesn't even let you use a whole 1050 disk!
If you use a sector editor to look at the VTOC (which keeps track of total and free sectors) of a DOS2.5 disk,it'll say that there are only 720 sectors.Sector #1024 keeps track of the rest.So if you do a directory with DOS 2.0 or MYDOS,it'll say that the 1024-sector disk only has 720.

I'd like to see some sort of addition to PCXf/XL-It and/or Rainbow, of BASIC XE that works like a virtual cart. The mechanism programmed in a PC language (Visual BASIC/C...) that links into the emulator at the cart mem locations and provides access to the complete BXE language as if it was a real cart. SDX would be another one. I guess the authors of the emulators would have to add the hooks to allow this.
The command line would probably have to include a -c for use (virtual)cart and have you specify what "cart(s)" to access. This would mean still having only 8KB window and still be able to do stuff with the emulator.

Just a few thoughts/wishes... Hint... Hint...

Bill,

Thanks for responding. I renamed the file to mae11.arc and was
able to unarc it. I obtained the file mae11 by GOPHER via
netscape (there is only 1 file beginning with mae11 in the
Languages/Assembly directory). However, via WWW, I see there
are two files: mae11.arc and mae11.txt. This must be a
gopher problem.

In netscape try this:

GOTO URL: gopher://gopher.archive.umich.edu:7055/11/atari/8bit/
CLICK Languages
CLICK Assembly

now tell me what you see that begins with mae11*

There should only be one file, namely "mae11".

I get the same results in lynx that I get in Netscape.

A long time ago, I read that GOPHER was the best means of getting
to the archive, and probably still is the recommended way of getting
there...since it is #2 on Michael's list. From my experience, I would
now argue otherwise.

Come to think of it, other things do not look so peachy under GOPHER.
For example, you recommended to view the file "00.WEB.USERS.README".
Well, this file doesn't appear via GOPHER - but "00.WEB.USERS" does...
now try clicking on that...it leads nowhere!

In response to dklugh@iwaynet.net, you now have the address you were
looking for...go look for yourself...it should answer all of your
questions and comments.

Again, Thanks Bill! (No relation to Bill Nye? =)

>Maybe I just _hate_ java and don't know it yet. ;)

Aparently they expect you to go out and buy Windows to be able to use their sites.I use Net-Tamer v1.09 on the PC and the Sega Saturn's Netlink.
I never understood the point of HTTP.Gopher has all the same features and runs much more smoothly.I tried NetScape with the Linux X11 interface,and it caused the hard drive to thrash so much that it took for ever.I upgraded to 16MB of RAM and even though this meant no more swapping,it still had these pauses.
I've been told that the Netscape file contains the same libraries that are already present on your system.

>not a major deal for the 8-bits. Does anyone know of a replacement
>for the R-Time8 that supports 4-digit year?

Meaningless,since SpartaDOS will only see the "two digit" year.
6 bytes are used for the time-date in SpartaDOS.So the year could go up to 255.
I don't know about the R-Time8 cartridge.Year 00 would simply be 2000,and so
forth.It doesn't matter how it displays it,we'll know that a file marked 12 is
2012 and not 1912.It'd be nice if SpartaDOS took advantage of the fact that a
whole byte is used for the year to let the year go up to 2155.

332. Re: How to get access to some old "owner's manuals" ?

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-15 00:00:00 UTC
From: Laurent Delsarte <ladelsarte@skynet.be>
Message-ID: <33CB927B.8DBEE4B3@skynet.be>
Source record: 71752

Thanks for your reply.

Since English is not my native language, I dread that my sentences did not express my thoughts. I have some technical information about the devices and the machines I own. I've got some technical books, I've got "De re Atari". But, still, I'm looking for some original "owner's manuals" because I miss them. I don't expect to get very exiting information in there but the quest for the books is part of the game for me.
Let me say a few words about the manuals. I've got three 1050 drives, all 3 with complete books and boxes. And the 3 drives come with 3 different manuals ... One is a really useless but superb A4-format color high quality paper with nice A4-photos. I really enjoy owning these books.

So I'm just looking for a resource on the net where I could find online version of these books or real books ...

If you know a site, please drop me a line.

Note 1 : 1010 is the Atari cassette player and recorder with the "xl" line design
Note 2 : I also appreciate MYDOS very much.

I am posting this for a friend.
He has:

a an XE game system
reconditioned 1050 floppy drive
an atari daisy wheel printer
lots of carts and disks

if your interested, make an offer on what ever you want and email
me at mlunde@geocities.com
I will pass the mail on to him and you will deal with him. His name is
Erik.

334. Interest in 3 classic atari games

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-15 00:00:00 UTC
From: Staff <clauss@mail.oric.com>
Message-ID: <01bc9149$84a8daf0$0927bbc6@pcsupport>
Source record: 71754

Hello,

I am looking for 3 Atari games. All are disk based for the 8-bit Atari.

Wizard's Castle - Find your way to save the princess in the Castle. Find the rock in the dessert to kill the snake. This is a very old graphic game from Sierra On Line. (About 1981?)

Nukewar - a text based game where you have two grids - yours and an enemy. Sort of like an advanced battleship.

Planet Miner (?) - I think this was from SSI. You have to travel through space and keep up production to dominate the galaxy. Also a text based game.

Please let me know if you can lay your hands on any.

Thanks
Chris

I thought the AT-88 series were all single density? I have a RFD series
drive that is double density/double sided. None of the AT-88 series
drives I have seen were double density, thought someone once mailed
me saying a DD upgrade existed, but it was not factory installed.

"UNIVERSE" v. 1.2 (5-27-84). written by William G.H. Leslie III
and Thomas R. Carbone (C)opyright 1984 by Omnitrend Software.

"UNIVERSE" was first advertised in _A.N.A.L.O.G._ #14, Nov.-Dec.
1983, the last bi-monthly issue of this wonderful, and terribly
missed, rag. I haunted the computer store in 1983 awaiting, with
extreme impatience (bi-monthly mind you), _A.N.A.L.O.G.'s_
arrival. For several months, until my subscription finally
started, I made a 100 mile pilgrimage to purchase _Antic_.

I own an ATARI 400 (48k Austin Franklin, _Antic_ audio/video mod, and B-key keyboard [worn out and replaced with the original *INDESTRUCTIBLE* membrane]), a MEGA 2 ST, a 486 DOS/WIN3x, and a Cyrix 200+ WIN95 MACHINE. None of the later machines, _/*NONE*/_, at its best compares favorably with what was being done in 1984 on ATARI computers. Since I've owned an A8 I have been continually disappointed by the performance of other platforms. My reaction to the newer machines has been "Oh ... that's nice. I keep mistakenly expecting bigger, faster, and more expensive to be proportionately superior and this just hasn't happened. I still use my 8-bit, powered it up to check the abovementioned copyright, but it's getting to be a downright nostalgic experience. I'm sorry to say that, in my case, over the years intervening since 1983, I began computing using Uncle Clive's heretofore unmentioned wonder (T/S 1000, 1k indeed), a great deal of fun has been lost from computing.

I remember a review of it in one of the mags, but I can't remember which. I do remember it had a picture of the manuals (a three-ring affair) open to a page showing - get this - ORBITAL PLOTTING! I've wanted to try it ever since, but I don't see it on Yogi's.

> the last bi-monthly issue of this wonderful, and terribly
> missed, rag.

It then went monthly? I have quite a few of them stashed somewhere, unless my folks tossed them. I found it to be a much better mag than Antic.

While on the topic, a friend of mine was recently involved in a terribly house fire, luckily no one was hurt. However all of his A8 stuff was drenched, including several disks containing some original games he wrote. He's vowed that if he can get the disks working, he'll post the games (and utilities) to the 'net so that a chance happening like this will no destroy irreplacable code.

> mod, and B-key keyboard [worn out and replaced with the original
> *INDESTRUCTIBLE* membrane]), a MEGA 2 ST, a 486 DOS/WIN3x, and a

I had a 400 with the membrane, it was rather destructable in my case. I was the only person I know to have this problem, but the glue on the left hand side of the keyboard came unstuck and the keys ended up "bubbled". Rather annoying. Still, I remember my 400 as being one of the best built computers I've ever had, solidly built with that huge Al chassis, parts that fit and clicked into place, that _wonderful_ serial port and all the rest. As good as my 400 was, my 520ST was bad - poor construction, cheap materials etc.

What you have is a Percom AT-88 double-density disk drive. The extra space is for an optional second drive, not a hard drive, though, considering how much it weighs, there could be anything in there, right? ;-) The card sticking out the back is for adding up to three "slave" drives--Percom drives with no controller circuit. Thus, the first drive cost more than other competing drives, but the slave drives were much cheaper. Alternatively, you could daisy-chain it with other conventional Atari drives via the SIO ports. You should be able to use it as is, just like any other Atari drive, assuming it's still functional.

Yes. This is B&C ComputerVisions and YES, they have most of the original manuals. Contact them at http://www.myatari.com . Just click on the reference at the left if it is displayed as a link. otherwise use the URL as listed.

Hello,

Second post about this. I don't know where the first one went.

I am looking for 3 Atari 8 bit computer games. One is probably public domain.

Nukewar - two grids - text mode - sort of like an advanced battleship.

Planet Miner (I think) - dominate the universe by mining planets and protecting them. I think this was from SSI.

Wizard's Castle - from Sierra On Line - A graphic adventure game. You type in commands to tell the computer what to do

Please CC clauss@mail.oric.com if you reply.

Thanks
Chris Clauss

Hello fellow collectors.

I am in the process of adding 2 new sections to the Atari 800/XL/XE cart list. I've enclosed the new sections below. You can get the entire list from: http://www.execpc.com/~krieg/VidGames.htm

The first section contains authorized duplicate carts (previously released titles). I know there are quite few more Atari titles that were re-released with RX... catalog numbers (originally released with CXL... numbers). Please check your carts and send any updates.

The 2nd new section contains all of the multiple revisions for some of the application carts. Please check if you have any other revs than what are already listed. I'm also not sure if I have all of the OSS/ICD/FTe revs labelled correctly. What exactly was the connection between these companies (especially ICD and FTe) and do my listings for them look accurate?

Finally, what games supported the Track Ball besides Missile Command?

```

Thanks for the words on Forem XE-Pro, and even I must take some blame for
some of its comparative sysop-unfriendliness. I had meant to write up a
full documentation on it, but we can all see where that went (I pulled the
plug on my BBS 2 years ago).

If anybody wants the FXEP package, please let me know and I will put the
best of what I have (including some of the better online games) on my web
page.

http://members.aol.com/lenspencer/

(The page ain't much right now, but it is still under construction and
revision.)

>
>This group has far less spam than most.

In fact this group has virtually no spam (like every group that
doesn't have the word "sex" in it's name).
Normally spam is cancelled by people running so-called cancel-bots
(see the NetAbuse-FAQ for more info). But last week they were on
strike to show all people the increasing intensity of the spam
problem.
That's why it looked like as if there was an increased amount of spam
even in the "normal" groups...
On Monday the cancel-bots started again...

>Personally, I wouldn't favor strict moderation, especially in a
>newsgroup which only gets maybe 25 articles a day.

Me too!
Furthermore moderation isn't the solution. There were even cases, when
spammers were able to even spam into moderated newsgroups (by forging
the approved: header). And when the moderator retires and no one wants
to do the job, the group would be deserted...

>Preferably,
>everything would be relevant, but as long as spam and flames with
>excessive personal insults or profanity were removed I'd be happy.

Killfiles work wonders!
I don't want someone to decide what is best for me...
I want to choose what I want to see myself...

>I used to despise services which censored their forums.

Me too!

>In these days, with spam,

Yes, spam is an increasing problem!
But it is worked on and it is still far away from threatening the very
existence of usenet!

>flames

Flames have always been there...
That's nothing new!
Use killfiles to filter out the offending people!

>and WebTV around,

I haven't seen anyone posting from WebTV in that group, yet!
So I don't see the problem...

>I'm rethinking my position a bit. Problem is, I doubt that an online service could carry
enough
>traffic to justify carrying a group similar to c.s.a.8.

Well, I don't think you'd really want to give up this group and move
to an online service...
Most people who are posting into c.s.a.8. now wouldn't have any chance
to post into the forum on an online service. Online services are
always restricted. The great thing about the Internet/Usenet is it's
globality...

Don't think about giving up such a great thing as Usenet is just
because of the spam and bad manners!
Just filter them out, accept it or join the fight against spam!

Never forget:
The price of freedom is eternal vigilance!

[Sorry if two copies appear...ISP problems..again]

Need to clear out some of my collection for sorely
needed space...

I have available for sale, 4 Atari 800XL computers.

All are the bare CPU, all work and have been tested.
You will need the appropriate power supply to run them.

They all have been cleaned inside and out, and the
keyboards are pretty clean. All are "slightly" different
based upon the case, keyboard or motherboard design
and components..apparently Atari used multiple vendors
for various parts.

Prefer to sell as a single package for $36, or I will sell a
pair for $20, or individually for $11 each. (I really want
to only pack+ship one box, thus the discount for all 4.)

Shipping is not included, I can ship via UPS ground or
USPS priority mail. (I can only ship to US addresses),
send me your zipcode so I can quote you the actual cost.

Prepayment in the form of money order or personal check.
Mutiple references available upon request.

Thanks in advance!
Bill

Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,rec.games.video.marketplace

[Sorry if two copies appear...ISP problems..again]

Trying to clear out parts of my collection as I sorely need
the space.

I have for sale a Commodore 1702 Composite Monitor that
works great when connected to any Atari or Commodore home
computers, or any VCR or the newer video game systems.

It has the two front jacks for composite video and audio, as
well as the rear jacks for separate LUMA/CHROMA and audio.

It has been cleaned inside and out, looks in good shape, however
has one minor flaw: It is blurry during the first 10 or so minutes
of being on. After that is is crystal clear for as long as it's left
on. So long as you let it warm up, it looks great--sharper than
most 13" TV's you might have your system connected to.

The picture is bright and full contrast, even with controls set
in the middle (it's not going dim or anything)

The cost is only $35.

Shipping is not included, I can ship via UPS ground,
send me your zipcode so I can quote you the actual cost.
(expect around $15 is my guess due to the weight of the tube)

Prepayment in the form of money order or personal check.
Mutiple references available upon request.

Thanks in advance!
Bill

It really wouldn't be as helpful as you might think.

Even moderated newsgroups fall prey to spam. It's harder for spammers to
do and is more frowned upon, but it happens all the same.

Until the problem becomes really significant (take a look at
comp.sys.atari.st), it's not worth worrying about.

Rainbow, of BASIC XE that works like a virtual cart. The mechanism
programmed in a PC language (Visual BASIC/C...) that links into the
emulator at the cart mem locations and provides access to the complete BXE
language as if it was a real cart. SDX would be another one. I guess the
authors of the emulators would have to add the hooks to allow this.
> The command line would probably have to include a -c for use
(virtual)cart and have you specify what "cart(s)" to access. This would
mean still having only 8KB window and still be able to do stuff with the
emulator.
>
> Just a few thoughts/wishes... Hint... Hint...

Well... Rainbow can already do this (run bank-select cartridges, that is).
The tricky part seems to be getting the ROM images themselves. Rainbow's
author, Chris Lam suggests using an EPROM blower. I have information about
the layout of the ROM image Rainbow expects if you want it. Chris
undoubtably has some OSS supercart images in his posession, but appears to
be unwilling to pass them on to anyone, no doubt out of respect for
copyright law.

I want to take a look at some demos in *.DCM-format.
Therefore I'm looking for a emulator that can handle this format.
Or is there a utility to convert DCM-Files to ATR, BIN or XFD-Files ?

Thank you for answers !

I have an Atari 800XL that I would like to unload. I would like to sell it all in one shot. Well hear is a list of what I have. I will also accept offers for Star Wars toys. Buyer agrees to pay for shipping.

1. Atari 800XL System with power suppply and swtich box.
2. Carts
a. Frogger
b. Time Bound
c. Star Maze + Instructions book
d. Fraction Fever + Instruction book
e. Master Type + Instruction book
f. Centipede
g. Star Raiders
h. Pengo
i. Dig Dug
j. Choplifter
3. Tapes : used with a tape drive
a. Gambler
b. 128 Colors + Sunset
c. Jack Pot + Shoot
d. Lunar Lander + Flip It
e. Kidnapped + Titatn
f. Database + Microtext
g. Hangman (with instructions on tape) + Hangman game only
h. Atari Safari
I. Cavern of Mars, Space Invaders + States and Capitals
J. Sargon II Has instruction booklet but I think that the cover was ripped off
k. Monkey Math + Instructions and uncolored Marc and the mathfactory coloring book
l. Quest
4. 51/2 disks comes with slightly craked storage case about 1 inch on the front
a. Star Base Fighter + instruction book
b. Axis Assassin
c. Nightraiders + instruction booklet
d. Nibbler + instrctions
e. Manic Miner
f. Sargon II
g. Copy of misc. games
h. a disk that says formated
i. Dos 2.0 text adv. Auto-menu
j. Mater Disket 3
k. Dos Work File

5. Atari 1025 printer + owners manual
6. Three ring binder containing
a. Atari Service Contract
b. 800xl Owner's Guide
c. Copy How to Use manual
d. 400/800 Basic Reference Manual
7. 1050 51/2" disk drive
8. 410 Tape drive

Atari items for sale. I'll pay one half the shipping and handling costs
but NOT the C.O.D. charge. If you don't believe the prices are fair I am
willing to listen to your offer. Enjoy!

1) Flight Simulator II --subLogic flight simulator. Original box and
manuals. Including the
navigation maps. Price $10

2) AtariWriter and Atari Proofreader --the classic word processor and a
dictionary program.
Original manual including the quick reference sheet for the AtariWriter
but no documentation for
the Proofreader and no box. Price $20

3) Movie Maker --an animation construction set by Electronic Arts.
Original manual and box.
Price $5

4) 5"1/4" Disk Organizer with disks! --a grab bag of software everything
from Antic Magazine
disks to games like Mail Order Monster and Summer Games both classic 80's
computer games.
Price $20

5) Atari 1010 Cassette drive --not sure if it works but power supply and
light seem to work. Also
included is the data cable and a conversational French program. Has sound
and original box and
manual. If anything this is the first multimedia device for the Atari!
Price $5

6)Atari 1027 Daisy Wheel printer --not sure if it works but power supply
and light seem to work.
Also included is the data cable. Price $5

Bill,
As I understand it, the UNZip on the 8-bit is rather simple and is NOT PKUNZIP 2.04G compatible. I generally d/l to my PC then x-fer the files to the 8-bit, but not everyone can do this. Have the docs for programs as .txt files. Raw ASCII works fine on the 8-bit (but you knew that...heh...). Keep them in the archive files as well.
I really like the blurb files. At least it gives enough info to determine if the file is what you want or not. An index of the files with a one line description would be even better. One stop shopping so-to-speak. Ex.the index could be something like this:
dirname/path from root
Filename.ext date-of-U/L length-in-bytes(or KB: description up to one line w/o wrap.

Atari/8bit/dos
SD33-001.ATR 07/16/1997 360K: SpartaDOS 3.3 boot disk image for emulators.
SDTOOLS.ARC 07/16/1997 145K: SpartaDOS utilities pack.

What do you think? With this the blurb files could be canned and all files could be found easily.

Seems to me that a rewrite of SD is in order and a new RT8. Of course, that would mean incompatibility with all older versions of SD, but ... I guess it's time to finally learn how to use my MAC/65. Nothing is ever easy. It could be worse. This could be my PC. Lucky for me it's not.
I suppose there aren't any 8-bit programs that have been written to do 4-digit year anyway. So, I suppose the point is moot.
I'm just looking to make my system better and a bit more up to date (as that goes... heh...)

Christoph,
Go to gopher://gopher.archive.umich.edu:7055/11/atari/8bit and locate the file DCM2ATR.???. I forget what the extension is. Anyway, this will convert a DCM'd file directly into a /ATR disk image for you emulator.

: SDTOOLS.ARC 07/16/1997 145K: SpartaDOS utilities pack.

Not a a bad idea. I'd rather base the text on the blurbs, however...
so it would look more like:

Dos/Sparta

* SD33-001.ATR 07/16/1997 360K

SpartaDOS 3.3 boot disk image for whatever blah blah blah.
This is a release from FTe as of blah blah blah.
XL or XE required

* SDTOOLS.ARC 07/16/1997 145K

SpartaDOS utilities pack.

: What do you think? With this the blurb files could be canned and all
: files could be found easily.

And I'd much rather keep the blurbs around... imagine if you're FTP'ing
or HTTP'ing into the archive and are just curious about what "SD33-001.ATR"
is. Rather than going back two directories and then rummaging through the
huge index file, you can just click the "SD33-001.blurb" to find out!

:)

387. New Atr Utility

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-17 00:00:00 UTC
From: Ken Siders <ken_siders@compuserve.com>
Message-ID: <5qmalg$84g$1@gte1.gte.net>
Source record: 71657

For anyone interested I just put a new ATR utility on my web page. It will take almost any Atari Executable and
turn it into a small ATR file that can be directly with most emulators. Great for novices or anyone creating a front
end for XL-IT or other emulator. No need to run any DOS or menu program on the emulator.

URL is http://ourworld.compuserve.com/homepages/ken_siders/atari.htm

395. For Sale: More Atari Hardware, Software, Books, Etc.

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-17 00:00:00 UTC
From: bensmith@linda.teleport.com
Message-ID: <5qmsfq$b12$1@linda.teleport.com>
Source record: 71665
Cross-posted to: pnw.forsale,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

I've just added several BoxFulls of ST HardWare, Next I'm adding more SoftWare for the Atari 8 Bit. Check out my Catalogs for HardWare and Books as I have added more Items to the Catalogs.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a

special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

406. Great Find Today

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-18 00:00:00 UTC
From: gb899@cleveland.Freenet.Edu
Message-ID: <5qn00e$nfo@alexander.INS.CWRU.Edu>
Source record: 71676

This morning, my roommate and myself went on a thrift-run. Just
for the helluvit, we decided to check out a place here in Bremerton
called Smitty's. We go there every once in a while to see if he
has any odd power supplies or cartridges we may be after...

Anyway, Smitty is getting to know us finally, and when we walked
in he told us that we were hoping we would show up, because he had
something he felt that only we would be interested. (Seems most
of his customers are only interested in NES/Sega stuff.) He led
us to the same spot where only a year and a half ago we picked
up a nice CoCo II set. Taking up two large boxes was a buttload
of Atari hardware and software. Most still in the original boxes,
and all with manuals, power supplies, and connector cables.

Included in the lot were:

Atari 800XL
Atari 1050 Drive (2 of them)
Atari 1010 Tape Drive
Okimate-10 Color printer with all the stuff it originally came with
Atari 1027 Printer
Joysticks and paddles
A box of cartridges and tapes
And lots of disks, some with Commodore versions on the other side
(My C=128 was real happy about that. She was
starting to get jealous about me spending so
much time with the Atari.) :)

What made this a real great find was, we paid only $15 for the entire lot.
And Smitty included sales tax.

Good day, indeed.

CvO

Get Imagic95 at http://www.nacs.net/~classics if you have Win95 or NT
available.

I have a nice, clean, 65XE in the original box w/ book, power supply,
etc. Also has a Warp+ 4-in-1 OS upgrade pre-installed.

E-mail if interested. :) If you need information on the Warp+ Upgrade
its at the home pgae below.

Thanks

I've started work on a c++ version of APE under Linux. If you are interested
in testing it let me know. It's mostly just a skeleton now, but I would
like to see if it actually works on 'other peoples computers'. :)

You will need a recent kernel, the slang library, and access to a comm port,
hopefully as superuser. Also let me know when you e-mail if you have
a RI or DSR type interface.

You did say there was some space in the game core?
all that would be needed is some cool wallpaper, and a swing gun
. I hope I didnt forge your name on a contract to develope an 8bit
doom, But its posible to have a doom type game on the 8bit.
... :) I was also letting the readers know about that great Networking
game system you have. Perhaps someone will take the time to experment
with such a core. I have looked at the Game-link info but have not seen
the interface in action, but have seen your interface and it was fast and
practical.

Guy..

INFORMATION ON THE JULY 26TH MIST SHOW

(recently circulated by co-organizer Jeffrey G. Hammer)

Here is a partial list of MIST FEST IX vendors/user groups attending:

Nashville Atari user Group
Emulators, Inc (Derek Mihocka)
FMH Games
LCACE
ACORN.
LAG
ICD
It's All Relative.
Systems for Tomorrow
SCAT

Remember, because of the state of the Atari market in the U.S., this
may very well be the last great Atari Show in the U.S.

Location for MIST IX is the Post Road Community Center in southeastern
Indianapolis, halfway between Interstate Highways 70 and 74.

The location is south of Washington Street (U.S. 40) at 1313 South Post
Road.

Entry tickets are $1. Show hours: 10 a.m. to 3 p.m.

For details: Crossroads/MIST BBS U.S. = 317-535-1643
or csears at doe dot state dot in dot us

416. 8-bit File BBS in germany...

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-18 00:00:00 UTC
From: peter@soemtron.sb.sub.de
Message-ID: <6a4bPespzHB@peter.soemtron.sb.sub.de>
Source record: 71686

Howdy !

Is there any interest for a 8-bit file BBS System? I have the chance to organize a 8-bit file area special for us atari enthusiasts. You could download any 8-bit file for 100 percent free! Just use the guest-login (GAST) and have free acces to the best shareware/pd I collected for years.

yes I know, the internet is much more powerfull, but much german atari users don't have the chance to access the internet with a less of costs.

But that's not all, the "soemtron bbs" is the complete comp.sys.atari.8bit newsgroup routing via z-connect, so you can find your way to that powerfull information network.

I will repeat it: the "soemtron BBS" is free! No costs!

<sorry for all gramar mistakes>

.------------.-------------.--------------.------------.-----------.

for the german users:

wer von euch 8-bittern h�tte denn ernsthaft Interesse an einer BBS mit 8-bit Files? Folgendes: ich habe die M�glichkeit, in meiner Stamm-BBS eine Softwarebrett zu verwalten, speziell f�r uns XL/XE Oldie-Fans. Der Sysop w�rde daf�r sorgen, das jeder GAST 100% freien Downloadzugriff auf diesen Bereich hat. D.h. wer von euch aus der Fernzone anrufen mu�, kann entweder Files vollautomatisch requesten oder unkompliziert per GAST-login die mini-Files saugen.

Die Frage ist nur, ob ich mir die M�he machen sollte, wo heute doch jeder Internet-Zugriff haben k�nnte. (wie gesagt, k�nnte!)

Wenn kein Interesse besteht brauch ich mir auch nicht die M�he machen! Schaden w�rde es uns Atarianer gewiss nicht ;-) ... ahja, es wird nur Shareware & PD Domain sein. Aber bestimmt kein unn�tzer Trash, sondern handverlesene Software-Perlen!! ;-)

Oki, ihr Fans meldet euch!

How about a new "Asteroids" or some such game?

I envision smoothly animated rocks drawn in 16 shades (GTIA mode's fine
for me!) with P/M graphics for the ship, shots, explosions, aliens and
any other stuff that gets thrown in there. :)

Maybe I'll see if I can actually whip up a good graphics engine in Action!
:)

What programmes do you make/sell?

>Okay so I'm using AOL and I'll probably get flamed for it but
>here's my new e-mail

Oh,right,a BBS that you can only use with a single term programme;on the PC.
Now why would that be a cause for derision? <sneer>

Here's a idea,buy a ATARI!
(I play the cartridge verion)

>The program knows its a copy because it only bothers to load up the

Did it give a error when you copied your original disks to the ATR?
Only a bad/missing sector would let it know that it's the original copy.

>Chicago area and the WW1 game (omitting New York, Seattle etc) and
>then must be setting up some kind of decrementing counter which

It sounds like it has something to do with the dash-board clock.
It gets paused when you pause or go to the options screen.

>Seems like it would probably be a fairly easy job to discover the
>counter and NOP it out but to do that with ease you'd need a pop-up
>monitor of some sort and I don't have one!

Well it may just be a bug in the emulator.

So it emulates colour artefacting?

I have a card for my enhanced Apple][Enhanced that lets you use a RGB monitor
but everything comes out in 160x200 resolution.
(that is,one colour clock by one scan line.(if this was a TV))
But the E Apple2E supports 320x200 and 640x200 (albeit with under-scan).
So any graphical text in a game (or whatever) is impossible to read!
But the text in the text window looks alright.
(where as it would artefact on a composite monitor)
It's kinda useless.If I need to do work in 80 columns I'd just go out and buy a
monochrome composite monitor.
(which I have,though you might try adjusting the brightness knob)
As it is,it's useful for text programmes.But I have to keep a composite monitor
around for graphics.
So puting a pixel in a odd row (for 320x200) would produce one colour,and even
rows would produce another,but the pixel would always appear to have the same
location.(and be bigger)

Hopefuly it's not like my RGB card!

>The only problem is that the 800xl video seems to be somewhat
>oversaturated, so some lighter colors come out almost white. I have

Can you use a ZIP drive with a Atari?

You might look into a IDE drive for your Atari.You get 32k per second reads! It'd be faster,but you can't format IDE drives,so you're stuck with 512-byte sectors.So all access is buffered unless they come out with a 512-byte DOS.

They=Germans,probably.They come out with all kinds of useful things like TurboBASIC and rockets!
Of course Itay Chamiel,from Israel,invented Ice-T.He seems to be the only 80-columns term programmer that realized that we're not using a Apple or IBM, we're using Atari.(and the guy that made FlickerTerm-80,my favourite)
I forget who made the HIP and ColourView graphics modes modes.

I always wondered why people used emulators.I mean do any of them actually work for games that aren't simple arcade games (Pacman,Galaga,Wizard of Wor) or text adventures?
What about graphics modes that give you 64,256,and 4096 colours/lumnas?
What about AM (digitized) sound?

>"Computer Sematary" (Sem-Atari?)
>If you emulate an old Commodore computer, that would be a PET

From: kendrick@zippy.sonoma.edu
Message-ID: <5qrfh3$jn2$9@nuke.csu.net>
Source record: 71704

I haven't looked into it with much detail yet, but is there a problem
with using the 16-shade GTIA mode (setting mem. location 623 to 64)
when the screen is in Graphics 7 (160x96) mode?

I'm using this for my new Asteroids clone, and I THINK it's only showing
some of the shades. (I can't be exactly sure at this point, as I'm
using using random garbage for the asteroid frames.)

I don't want to kill myself trying to make the graphics here.

Any tips would be very appreciated. (Especially if they come very soon,
and are CC'd to my e-mail. ;))

From: Trevor Holyoak <trevor@holyoak.com>
Message-ID: <33D1A699.1F820E1@holyoak.com>
Source record: 71707

NOW AVAILABLE:

CDROM for PC with 600+ megabytes of files for the Atari 2600, 7800, and 5200 videogame systems, and the Atari 8-bit computers (400/800/XL/XE).

Contents

2600/7800: Docs, emulators, FAQs, manuals, and 675 ROMs for using with the emulators (play all the old games on your PC!).

5200: Emulator, FAQs, and 49 ROMs.

8-bit Computers: Docs, emulators, FAQs, manuals, and literally thousands of files!

You can run most programs right off the CD!

Price: $50 each (prepaid) + $3.00 Priority Mail shipping (cheaper shipping is also available).

E-mail me if interested!

(If there is enough demand I may also put together a package with the CD, an Atari computer (probably either an 800XL or an 800), and an SIO2PC adaptor so that you can run APE and the THOUSANDS of disk image files directly from the CD on your
PC.)

It's actually closer to 625 megs. It's the product of well over two
months of downloading (with a faster connection than a modem) - there is
so much stuff available it was not hard to acquire that much. I was
going to put on some Lynx and Jaguar stuff also, but I ran out of space.
I have uncompressed most of the files (although I left the .ARC files
arced) so that they can be used right off the CD - which, of course uses
more space than the
compressed versions that can be downloaded. I put a directory listing up
at http://www.holyoak.com/atari/ataricd.txt

The GTIA color processing options only work reliably on a mode line
that displays half-color clock pixels. (That's mode 2 [Graphics 0]
text, mode 3 text, and mode F [Graphics 8] graphics.) Groups of four
pixels are converted together into sixteen shade, color, or register
values (too bad there aren't 16 color registers.) In any other mode,
the color processing gets confused.

Offhand, I can't think of a compelling reason to turn on the GTIA bits
in any of these modes. You still get pixels 2 color clocks wide, but
have fewer colors available. If you need to have taller pixels, you
could consider using a new display list that repeats each line of
graphics data twice.

Given the current miniscule costs to burn CD-ROMS, isn't $50 a tad
high?

Just a thought, but did you contact all the people who hold copyrights
on any software/files/etc not explicitly labelled "Public Domain?"

>
>8-bit message base? So you can send inverse characters?
>

> >Tom... are you implying there's an Atari 8-bit web browser capable
> >of Java? :)

I think that you don't like java. Please don't take it out on me. I
didn't invent it. The forces of web evolution are always moving forward.
You and I can't stop it.

> >Tom - WHY did you pick Java!?

Because it is VERY difficult to NOT use java on a win95 based web server
for implementing things like message boards, and chat rooms. There are
some perl hacks out there for win95, but offer only limited success.
Especially when the host is a win95 system and using explorer 4.0 with
shell integration. Perl/cgi scripts can run a www board (which lynx can
use), but running a www board under this configuration of win95 is almost
impossible at this time. If anyone has been successful, I would be happy
to receive any and all advice on how to set up a www board on my web
server. Also, please, no "why don't you switch to"... whatever. This is
simply the system that I prefer.

Also, the company that offered the java message bases claimed that it also
offered their own www board for browsers that do not support java.
However, their claim was false. Their www board was so buggy that they had
to discontinue it. If they ever get their act together, I will put that
link back in to the message base page, and let you know. Then lynx surfers
will have access to those message bases.

>Why didn't you just set-up a MUD to chat in.You could make each room a
>different subject.

I've aquired the c++ source code to circle mud for win95. I'll see if I
can find somebody to compile it and get it to run when I have the time.

> >(pst, btw, I happen to have a great Lynx-compatible chat room
> >program available for free for Unix webservers ;))
>

Compile it for me, to run under win95 with explorer 4.0 shell integration,
and I'll run it on my web site.

>I'd rather a telnetable programme.
>
> >Anyway... don't take me too seriously... obviously I don't have too

> >Maybe I just _hate_ java and don't know it yet. ;)
>
The web is increasingly being configured more and more for surfing with win95 and explorer. Microsoft has become the driving force behind web development and shell integration, with others trying to catch up. ActiveX, Active Content, Pointcasting, Real Audio and Video, Java, Java Script, and Java Beans. These leave lynx behind in the dust. Still, whenever possible, I will have lynx compatable web content. Whenever it's not possible, oh well. I could have used even more java, but decided to make the most important features lynx compatable.

>
>Ok..I got it working on xl-it... now what were the key commands??
>
>I think I remember:
>B=booster
>L=land
>A=airlock
>

One of the last Atari manuals I have around is the Rescue on Fractalus manual. Here are the keys:

Start: Starts the game.
Break: Restarts the game from the beginning. The current score is lost, although high scores will be recorded.
ESC: freezes the screen during a mission. Press again to continue.
SELECT: Increases starting level of game.
SHIFT SELECT:Decreases starting level.
->: Increase thrust
<-: Decrease Thrust
L: Land
S: Systems; after you land use this key to turn all systems on and off. If you leave your shields and engines on, the powerful energy field around your ship will burn any nearby life forms to a crisp. Knowing this, the downed pilots will not leave their ship until your engines are turned off.
A: Airlock; you must open the airlock doors to let the pilot inside. The airlock will automatically close when the pilot is inside the ship, or if the engines are turned on.
B: Boosters; fires the booster rockets to return to the mother ship if it's oribiting in your planetary sector. You can't leave fractalus without firing your boosters.

These are all the keys it mentions.

Hope it helps,

Sean

>
> i'd like to proudly announce new discussion list about 8 bit atari.
>

You beat me to it. Here's what I was going to post:

There is a discussion list called atari8-l that has just started. It's
focus is to bring a8 coders together for the discussion, investigation ,
and possible development of a Un*x style operating system, similar to
OS/65. (I think that is the name of the new c64 o.s.). Also to be
discussed are the various programs that can be run under such an o.s. Like
tcp/ip, slip, etc.

If you are interested in participating in, or just monitoring the
discussions on the list, send an email to majordomo@zwieracz.psych.uw.edu.pl
. Leave the subject blank, and in the body put:

"subscribe atari8-l yourid@yourhost.com".

453. FS: Atari stuff

I have the following items for sale:

Ape Face parallel printer interface for Atari, poor physical condition,
but works great. $7

Axiom AT-846 parallel printer interface, very poor physical condition
does not work. $3

Okidata Microline 182 printer. $10

Epson LX-86 9-pin dot-matrix printer. Works great. $25 firm

Atari 1025 7-pin dot matrix printer. Connects directly to SIO port, SIO
cable included. $12

Atari Writer Plus, disk, manual, dictionary disk and reference card. $8

Bank Street Writer, disk only. $3

Compute Magazine disks, all from January '86 to April '88. These
disks contain all of the type-in programs from Compute magazine for
the Atari, including such classics as Speedscript 3.0 and many games.
All 10 disks in plastic case for $10.

Letterperfect with Xeroxed manual. 400/800 only. $4

B/Graph with Xeroxed manual. $4

Flight Simulator II cart (XEGS), part of label missing. $5

Atari BASIC cart, Revision A. $3

Compute's 1st book of Atari. $5
Compute's 2nd book of Atari. $5
Both of the above Compute books, $8

Stay tuned for more. As soon as I get my c128 system online I will
be selling what's left of my Atari system including a 130XE, another
1050 disk drive, and an SX212 modem.

Prices do not include shipping. I believe my prices are fair but if you
disagree please make an offer. I am in Dayton, Ohio.

> >Rainbow emulator blanks out the screen after approx. 40 seconds of
> >use.

I tried to write to Mr. Mellish at the address above, but was not
successful, so am posting here.

I've been running David Firth's "atari800," v0.8.0, on a VMS system under
the VMS Debugger. I'm finding that this is a really cool thing
because I can "debug" not only the Atari ML program running on the
emulated Atari," but also the emulated Atari "hardware" itself!

One handy VMS Debugger feature allows me to set "conditional breakpoints,"
which allow me to run the emulation until the contents of a variable or
memory location CHANGE, or take on a PARTICULAR VALUE. At the point of
the change, the emulation halts and I can backtrack and find out EXACTLY
the state of the machine's RAM, ROM, and "hardware." I'd ALWAYS WONDERED
how they did the scrolling-checkered gameboard in BallBlazer; now I think
I know! :-)

Anyway, given the above description of F. Mellish's problem with FSII, it
should take about one minute to discover precisely where, when, why, and
how the screen is being blanked at the 40-second mark -- and it should
then of course be a relatively simple matter to CHANGE that behavior.

So -- Fielding Mellish, send me a copy of the FSII .ATR file, and anything
else necessary to operate/run it, and I'll take a crack at your problem.

And -- David Firth, I'll be writing you some e-mail shortly, to discuss
Atari800 v0.8.0 and related topics!

Hope this helps,
Chris Chiesa

Corupted GZIPs wouldn't stop him from OPENING them,only Gunziping them.
Sounds like a corupted file system.Or GZIP is lying about not being able to open the file.
(MS-DOS programmes tend to lie about errors.But GZIP is UNIX in origin and shouldn't be doing this)

Message-ID: <869504466.25780.1.nnrp-5.9e9882d2@news.demon.co.uk>
Source record: 71598

Whilst reading the rubbish I usually find here, ASharkis wrote something in=
teresting about "Anyway we can make this a MODERATED group?"

Hello ASharkis,

A> I don't know that a moderator, a la FidoNet would work here. There are
A> many enforceable rules there, that we couldn't enforce here because of
A> the nature of newsgroups. =

There are already many moderated ng's. I take three or four myself. It ha=
s
to be said that, for the most part, they seem to be announcement groups,
rather than discussion ones.

For some reason, none of them suffer from spam. Well, none of those that=
I
take.

A> I also doubt that any moderator could be completely neutral and satisfy
A> even a majority of contributors. He'd be on a hot seat for any call

That's very true, but so longas as the topic of conversation was Atari
8-bits, wasn't promoting/discussing illegal activities, or flaming
somebody....

The moderator doesn't even have the luxury of using the killfile on the ng
the moderate. The main reason I've never stood as moderator in any of the
Fido echos I take. (It's been suggested that I do so, several times)

A> that any significant segment of the ng considers a bad call. And, he'd
A> have to have lots of hours just to devote to this task.

That's the other reason I've never wanted to do it: It eats in to *my*
time.

A> Anti-spam without a moderator is another topic. I don't think that

It's nearly impossible to eliminate, I'd have thought....

There's an alternative to going for a moderated ng: Set up a mailing list.=
=
Mind you, that means even *more* time for the maintainer. :-(

>
>

I don't know that a moderator, a la FidoNet would work here. There are many enforceable rules there, that we couldn't enforce here because of the nature of newsgroups.

I also doubt that any moderator could be completely neutral and satisfy even a majority of contributors. He'd be on a hot seat for any call that any significant segment of the ng considers a bad call. And, he'd have to have lots of hours just to devote to this task.

Anti-spam without a moderator is another topic. I don't think that bombing works, I know that bots are far from foolproof, and some spammers don't take ignoring their messages as a sign that w're not interested in what they have to say. All that we might be able to do is complain to the ISP from which the spams are sent if the subject matter is really objectionable/illegal.

469. Free Internet Access World Wide

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-20 00:00:00 UTC
From: Abdul Safar <ASE1000@1stfamily.com>
Message-ID: <7137cd$163b39.34@NEWS>
Source record: 71713

Greetings from 1stfamily,

As we all know unlimited Internet access is $19.95 / month
with every major Internet access company. From Netcom to
AT&T that price never changed. So what makes us any
different when we are also charging $19.95 / month ???

Our Marketing Plan.

Our method is this. Unlimited Internet access for $19.95 per
month. If you find our service to be extremely satisfactory,
in which we are sure you will, you can refer our service
to 10 of your friends and family. If you do , you will get
free Unlimited Internet access with your e-mail address
for life !

What we offer is this:

* The fastest, clearest Internet access in the world.

* World Wide Internet access in over 110 countries.

* An e-mail account that is also life time free if you refer
10 of your friends and family to using our service.

* America On-line for only $10 / month !

* Much much more that will amaze you !

Our plan is by the year 2005 we will be the world's ONLY
Internet service providers. With our technique of offering you
life time free Internet access we will be.

Please visit our web site http://www.freeisp.com/ any where
from the world to know more about our opportunity and to even
get on the wagon before every one else beats you there.

http://www.freeisp.com/

Please forward this message to all of your online friends. Wouldn't you
want all of them to get free Internet access ?

Abdul (SPONSOR ID # SAF5197)
Stop paying for Internet access !

ANALOG had a piece about "graphics 10/7" in the early 'teens (14? or so), where it was pointed out that not all possible colours were accessible - some were repeated.

Keep in mind that some of the colours draw their value from the PMCOLRx registers.

>
>Alan

Um, you wouldn't get the same graphics, but a Wolf 3-D clone wouldn't be out
of the question - the text modes for Atari are remarkable flexible,
especially with Character Set indirection.

As for WCII, you'd lose some complexity to be sure, but a real-time
resource-managing war sim wouldn't be impossible either.

(Mind you, I'd want at least 128k as a baseline for either project)

WarCraft wouldn't be so bad, depending on (1) if it were written for
say at least a 128K machine (if you want all the cool sound effects
and stuff) and (2) how complicated of a game you want.

Duke 3D wouldn't be too hard, depending on what you want out of it.
For this type of game, I'd say scale it down to at least
Castle Wolfenstien 3D (which doesn't have Up/Down look/fire ability.)

I think people are working on that for the Atari already, actually. :)

Ok, I'm actually doing it! I don't know how GOOD it'll be, but it'll LOOK
pretty nice (compared to any early 80 asteroid games ;))

I digitized an actual rock to make the animated asteroid shapes
(although I may re-do it since it didn't come out as good as it could of,
but it's STILL cool to see animated stuff flying around :))

and I drew the simple space-ship shape (which will be represented by
two Player/Missiles: one light blue and one dark blue) on a PC so that
I could get perfect shapes for the 16 directions the thing will face.

So... so far, I've got the actual game code (most of which I wrote
late, late last night (uh oh! :))), some raw PGM graphics files, and
two nearly-perfected conversion programs.

I hope to stick in some other nifty effects, more game variation stuff,
an alien UFO, and possibly a little full-screen animation clip "intro"? :)

I may have this thing released within a few days, although I won't be
around to program tomorrow, and will be working all(?) this week.

You'll of course all be informed when it DOES come out. :)

> bne loop
> rts
>
>Why WON'T WORK iT???? The little program doesn't repeat the getchar/
>putchar subroutine.
```

It won't work because the 'getchar' and 'putchar' routines are I/O routines, and the Atari OS uses the Y register for returning status of I/O operations, with 1 meaning good status (no errors). When it returns, the 'dey' instruction makes it zero, and that is why you only get one time through. You need to declare a byte location for the counter something like this:

```
lda #4
sta count
loop jsr getchar
jsr putchar
dec count
bne loop
rts
count .byte 0
```

The 'count' variable will be untouched by anything except your loop routine, so this will loop 4 times.

Hope this helps.

This CD is intended to be a convenient archive of all the stuff anyone could download from the Internet. It is assumed that anybody using any of the copyrighted files on the CD is a legal owner of the particular file. I really don't expect to make any money off of this CD - the amount I am charging will (hopefully) cover my expenses and time. A lot of work went into this so that Atari fans don't have to spend a lot of time hunting for stuff on the Internet and downloading files.

AFAIK, the left/right/up/down lines are read as quadrature (?) values and the left mouse button is connected to the standard joystick trigger. This leaves the two pot lines (for paddles) for the right (and middle button if present.) I think you might be able to read the buttons by testing paddle values. (?) or you may have to add some hardware first to get it to work.

Nobody asked me, guess he could care less about the distribution
terms of the included software. And people wonder why few take
time to support the 8.

493. NULL MODEM: PC <--> MIO

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-21 00:00:00 UTC
From: cowpoke1@hotmail.com
Message-ID: <869521946.26360@dejanews.com>
Source record: 71537

This past weekend I tried to get basic communication working
between my MIO RS232 port and my PC's COM2: port. I purchased
a NULL MODEM adapter from a local electronics store and hooked
the two devices together. On the atari, I started up Bob term.
On the PC I started up PROCOMM PLUS.

I was completely unsuccessful in getting the two to communicate.
Do I have to load an R: handler on the ATari, or is this not
needed when using the MIO?

I believe I was running under Spartados.

Any help?

Hold on a minute - your user's manual says: "APE is user supported. This means that you may copy UNREGISTERED VERSIONS freely and give the copies away to anyone you wish. They are in turn requested to send in the registration if they decide to use it. You can help me distribute APE to others who might find it useful by uploading it local BBSs and by giving copies of it to friends, user groups, and business associates. Thank you for supporting the Atari Peripheral Emulator and the Shareware concept."

Unless I am badly misinterpreting this, you are giving me permission to give copies of the shareware version of your program out. That is what I am doing. As far as I know (and I have been made aware of one exception), all the emulators on the CD are shareware. I am actually doing you a favor by distributing it. I happen to be a registered user of APE. I got the shareware version of it from a CD similar to the one that I have created. I used it, liked it, and paid you for it. I thought that some improvements could be made on the CD, so I decided to go ahead and make my own - that's how this came into being. I have arranged things on the CD to make things easier on the APE user. I'm sorry if I have offended people by offering the files on this CD, but I don't see the difference between having the same files available for download and having a CD available for the convenience of people who'd rather not go through all the trouble.

> And people wonder why few take
> time to support the 8.

I thought that was exactly what I was doing. I am a huge supporter of
the Atari 8-bit computers and videogame systems. I maintain a web page
dedicated to them and am constantly helping fellow users out with them.
I'm sorry if some find this offensive.

Okay, how about this one: In the Doctor Who episode "The Caves of Androzani" all the computers in the nerve center of the underground complex appear to be Ataris. I recognized the screen font when I saw it years ago. You can't see any actual computers though. The displays show locations of various things in the network of caves and tunnels and later display a count-down timer for a nuclear bomb which has been set to detonate.

Another one: Not actually an Atari computer, but a peripheral can be seen in the 1992 movie "Sneekers". There is a scene where the protagonists, an elite band of computer hackers, is hacking into a high-security computer network using an assortment of equipment including, of all things, an Atari Acoustical Coupler 300 Baud Modem. :-)

Not a bug exactly... None of the emulators can run copy-protected programs because they are not being run from an Atari drive and it's not really possible to have "bad" sectors in a disk image since the "disks" emulators read are nothing but binary data. Interestingly, the ATR format includes a header in which bad sectors can be mapped, but no emulator I know of utilizes this data, and AFAIK, no disk images use it either. The only way to run copy-protected software such as this on an emulator is to use a cracked version in which the copy-protection has been removed. Unfortunately, there does not appear to be a cracked version in the usual places on the internet. If you really want to play it, take Daniel's suggestion and get the real thing. They're really cheap nowadays!

Hallo !
```

Thats the most important problem, indeed.
We relayed in Klaus Peters, but he went out of business.
So please tell us, where to get such adaptor to get an XL-like PBI on
XE-machines.
We re especially interested in Europe offers.

```
Thanx, Matt
```

Congratulations!

I might as well tell everyone about my great find this past weekend. Our
local school district was having an auction. I didn't go to it because
I didn't think there would be anything there for me, but I did have to
go there for a meeting after it was over. There was a ton of Apple //e,
color monitors, and TVs. After rummaging through and putting together
a complete Apple //e system, I found several boxes of Atari Hardware,
including 2 800XLs and 3 800s, 1 810 Disk Drive and several 1050 drives.
Everything was in perfect shape. Anyway, after I piled up everything
that I wanted, adding an old Mac 20 meg HD, two Apple //e Profiler
hard drives, and 1 19' TV, 3 color monitors, they told me the
damage, $10!!!

I must disagree with your comment about Microsoft being the driving force
behind the net. Microsoft has been playing catch-up, and they still
haven't increased their marketshare of the browser market, even with
giving their product away.

Anyway, my personal preference for running a website on a budget is to
use Red Hat Linux or FreeBSD, but that is a topic for another newsgroup!

OBAtari8: I've seen talk about projects with the 8-bit. What I would
like to see would be some browser for the 8-bits. I've been looking at
the WebTV, and thinking it would be pretty nice to be able to at least
pull up TV Guide's site to check out the channel listings on the TV.
First we would need a TCP/IP stack and PPP. I've built David Deaven's
Infrared Gateway, so I can receive signals from a remote to my 8-bit.

Well, I don't think that we should go to a moderated newsgroup. I just set
up a kill file which helps a lot. Basically, it kills anything with the
following in the subject line: $, get rich, money, xxx, cash!, cash.

(BTW, hey Bill, glad to see you around!)

Since only four wires are used, could you install a phone outlet into the
Atari and use regular phone cord to network with, maybe creating a box
to plug more than two Ataris together.

Anyway, the game I would like to see would be an updated Spy vs. Spy,
with up to 8 players competing against each other!

First of all, as far as Carina goes...

To the falsehoods posted about it...

Carina 2.3 and later does support FULL color ANSI!! I had been running Carina, and I myself have written ANSI coded software for the BBS, and all my IBM callers, including myself to my BBS got FULL color ANSI...

David Hunt has also gotten it to work with the ZOOM 28.8K modem, but with the 56K and new 67.2K modems out, I think the speed is dead, since the Atari can only communicate over the SIO cables at 9600 baud a good 28.8K connect still transfers slower than 9600 baud.

I was going to write an IBM version of Carina, but am still trying to find a good Basic to work with, and be able to afford it, PowerBasic 3.2 looks fine, but at $129.95 or $149.95, it's a little too much right now..

I was an avid Atari 8-bit programer, our titles are still available, but thanks to PIRATES who had NOTHING better to do than reverse engineer our programs, I don't advertise it anymore...

I rewrote ALL my Carina moduels, games, utilities, etc., to support VT52 and ANSI color, but again, all the 8-bit users want is GIVE ME GIVE ME, they will not pay for anything!!

I worte an USPS Barcode progam for the Atari 8-bit to put the 9 and 11 digit barcodes on mailing labels, approved byt he Postal Service to qualify for the barcoding discounts, and I posted this, but no one ordered it...

I don't blame Shadow for doing what he's doing, because of my experience with the users of Carina, etc..

Carina DOES support ANSI, I even took the MOE Source Code, which Shadow released into Public Domain, and modified the ANSI-MOE to support the XEP-80 80 column card, and had this all working on my computer, ANSI callers had the FULL ANSI color etc., then everyone wanted a ZIP utility for the 8-bit, I was working on this, but again, NO ATARI 8-bit owner wants to spend one cent on anything!!

Look at how long I've been advertising this 8-bit stuff I had for sale!! One guy tells me I'm insane wanting $125.00 for the ATR8000 and Dual Disk drives, then he turns around and tries to sell just the ATR8000 alone for $135.00!! that he had!!

Anyone wanting any of our Atari 8-bit Software, it is ALL Copyrighted, and is still available, but don't look for new titles, because I have given up on the 8-bit Atari, and just keep what I have for museum pieces, except the stuff I do have advertised!

>>

Unless the year 2000 is exactly the same as the year 1900, the program
will mess everything up... ie., Wednesaday could be a Monday that
particular year..

There was a ML patch to fix the bytes in the TD file that would solve
this problem, I've probably got it on disk somewhere, but as I said,
it is useless to me, as my Atari is just collecting dust and I qon't
go through ther boxes of thousands of disks to find the patch for
anyone...

I agree with you ... Get the ATR2DISK.ARC at :
closertohome.dyn.ml.org It will turn those ATR files back to
Atari disk both 90k and 130k formats.

Thanks to TOM HUNT we have a way around those ATR files.

> loop jsr getchar ;get key and load it in accu
> jsr putchar ;put accu-char on actual cursor position
> dey ; decrement accu by one
> bne loop
> rts
```

There is a BIG chance that in those subroutines (GETCHAR and PUTCHAR) the Y-register is modified.

If y isn't touched in the 2 subroutines it should work, but if y IS modified (perhaps everytime Y is set to #0 in the routines) It ever failes.

You should in the BEGIN of the "LOOP" routine: push Y to STACK (there isn't a mnemonic for, so: TYA and then PHA
BEFORE dey you have to write:

PLA (pull A) TAY

and then it might work. (if those 2 subroutines aren't fooling around with the stackpointer etc.)

Don't be frustrated. ALL things go wrong with 6502 language are EVER your own fault and that couldn't be frustrated.

```
> Why WON'T WORK iT???? The little program doesn't repeat the getchar/
> putchar subroutine.
>
> this one works:
>
> loop 'doanything'
> clc ; clear carry
> bcc loop
>
> --> an endless loop...
```

Ofcourse this works!!!!! in basic this would be:

```
10 a routine
..
..
100 C=0
110 IF C=0 then goto 10
```

Sure this works hehehehe.

But in the first program you are comparing Y, but the value IN y isn't eternal hehehe.

succes with it.

More questions? Feel free to ask.

Thomas,
It should be available for purchase in cart form from http://www.myatari.com (B&C ComputerVisions). BXE is definitely a great version of BASIC. I love it. Just wish I could use it with my PCXf 3.60 emulator.

Also check out D.A.R.Y.L., from the late 80's. The robot kid is seen
playing Pole Position early in the movie (on an 800XL, I think), and
later in the movie is playing BOTH Pole Position and Caverns of Mars
at the same time (ever tried it? It's almost possible!)

I'd rather not fill my mailbox with more stuff. The I-Amiga mailing
list is mirrored/repeated in bit.listserv.i-amiga newsgroup and posts
made to the newsgroup are also sent to the mailing list. I wonder if
a mechanism like this could be worked out for the atari8-l.

Nope. Fred Savage is playing Hardball on a Commodore 64, although the
sound effects (like most computer/video game sound effects on TV and
movies) are from the Atari 2600.

e.g. when each pair of mode F lines in a display list uses the same
data you've cut the amount of graphics data in half (96 scan lines vs
192). Turn on the GTIA bits and you have a sort of mode 7 GTIA --
GTIA color scheme with 80 pixels across, but with a mode 7 number of
scan lines.

>Nope. Fred Savage is playing Hardball on a Commodore 64,

You sure about this??? I remember the text on screen looked too wide
for the C64 character set. (C64 video timing is weird, the whole
display is much more narrow making the C64 pixels (and thus
characters) more narrow than the equivalent sized pixels/characters on
the Atari 8-bits. I have the video. I'll review it tonight.

>although the
>sound effects (like most computer/video game sound effects on TV and

The sound looked well sync'd to the video game. That's an awful lot
of work to go to just for 5 seconds display in a movie.

Hi, fellow 8-bitters!

I've been using Atari computers since I was 12 (I'm 28 now), and I've gathered quite a few pieces of hardware and software that I've never seen mentioned anywhere on the websites or newsgroups.

The first piece of history is the Monkey Wrench II cartridge that went into the right slot on the 400/800 series. It was a basic add-on that did such things as auto line numbering and re-numbering as well as a great hex editor and machine language monitor that would allow you to easily copy binary cassettes (and some disks).

Another piece of hardware I got was the Parrot sampler. The audio quality was (obviously) poor due to the MHz limitation, but it was still fun to play with, especially the drum machine feature.

On the software side, I got a disk called the Pirates Treasure Chest that was packed with disk, tape, and cartridge copiers, disassemblers, disk utilities, etc. that I have yet to see anywhere on the internet. I'm curious to know if anyone still owns the rights to this package. It's a great set of utilities and I'd hate to see this one fall by the wayside. I've copied my entire collection over to the PC with SIO2PC since my floppies are over 12 years old (the Elephant disks really DON'T ever forget!) and I didn't want to take any chances, so this means I've got the PTC in .ATR format, ready to pass on as long as it's considered PD software. I'm happy to share whatever I can, as long as I know it's legal.

I'm curious to know if anyone else has any of these pieces of history.

Yup. I've run every game I used to play on my 400 on the emulator I have for my PowerMac. Works like a champ. Everything I've pulled from Yogi's worked fine, except for ones where the "crack" appears to be bad and I don't think it would work on a real Atari either (some Epyx flight related/dogfight game comes to mind).

Why do it? Because there were some amazing programs from back then. I loved Necromancer and Eastern Front, and I get to play them again without the fuss of an actual computer. Whole collections of Yogi disks take up practically nothing on my hard drive, so why not do it?

> What about graphics modes that give you 64,256,and 4096 colours/lumnas?

Yup.

> What about AM (digitized) sound?

The version I have is the demo, so I don't have sound. I could tell you in the future though, when I register.

I

Does the MIO use the Atari, or PC standard for it's RS232 port? If the
former, then your null-modem cable will need to be re-wired, since Atari's=
9
pin serial port predates the PC version, and doesn't correlate.

I have yet to encounter an Atari 8bit emulator that runs digitized sound effects. For some reason Xlit and Xformer both fizzle with static, can;t comment on Rainbow (I dont have W95!)

but Xlit 0.20 emulates the Atari sound chip almost perfectly.

> Why WON'T WORK iT???? The little program doesn't repeat the getchar/
> putchar subroutine.

I found the error for my self. The getchar/putchar ($f302/$f2b0) routines
changes the x and the y register. That's why it won't work all the time..

z1 = 1536

ldy #$04
loop sty z1
jsr getchar
jsr putchar
ldy z1
dey
cpy #0
bne loop
rts
```

some better solutions? Why won't work stack movements? (loop .. bne ?)

What does Ortman do is a good question.....

If you search his posts he claims to have an IQ of around 300
although it seems anyone tested over 220 is registered and they have
never hear of him

He recently claimed to run a multi-million dollars business,
although he posted last year he barely got by.

He claimed to be a wounded Vietnam vet, then just a wounded vet.
Somebody checked, they never heard of him

He claimed to be running a business that competed with the local cable
company. The State Police seized his equipment. Seems he was
selling descramblers to somebody elses cable.

He has been banned from FidoNet for scamming people and being
really obnoxious

He has been accused of doing the same on UseNet

He also claims to be suing everybody who doesn't like him for billions of
dollars.

ect.....

The following games are for sale. I'm asking $2.50 for each, or make a reasonable offer; I just basically want to cover postage and packing costs and am otherwise willing to give these away for free.

Mail Order Monsters (Electronic Arts)
Galactic Adventures (RapidFire)
Ace of Aces (Accolade)
Wargame Construction Set (SSI)
Alternate Reality (Datasoft)

I released Carina BBS as shareware a while back, and the entire latest release should be available on Tom Hunt's Web Site/BBS.

If you decide to go with Carina, you ccan also join our network, and get the usenet newsgroups as well!

Holler if I can be of further assistance.

The Shadow

PS: It should also be available at http://www.teleport.com/~bensmith/

before i buyed disk drive, i ownet cassette recorder for about 5 years. the
last 2 years i used modification named turbo 2000 kso
(kso = kasetowy system operacyjny = casette operating system), which boosted
up the speed ten times. the operating system was simple, located on a
cartridge. cassette recorder was modified, additional cable was connected to
port of second joystick. this turbo system used modified D: device driver.
loading procedure was pretty simple: the system looked for a header, and when
he found it asked if i wish to load this program (something c=64 style).
overall, the system was useful. and cheap - and that was the most important
these times...

547. FS/T: Atari 8-bit computer items [07/21/97]

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-22 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <33d50a2f.150329@nntp.ix.netcom.com>
Source record: 71553

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 07/19/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$10.00 Home Filing Manager, The (Atari)
$10.00 Print Shop, The (Br0derbund) {3}
$10.00 SynFile+ (synapse) {2} -- also includes Reference Card
$10.00 Timewise (Atari) {1}
$10.00 Touchdown Football (Electronic Arts) {2}
$10.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$10.00 Ballblazer -- XE cartridge

$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 9.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$10.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$14.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 400 COMPUTER with power supply, built-in RCA cable, one
Atari Joystick, and three [3] cartridges [no boxes, or manuals
for cartridges]:

Basic -- for use with the Atari 400 and 800
Missile Command
Space Invaders

This is a complete system, except for RF switchbox. This system
also includes the Atari 410 Program Recorder (listed below), at no
additional charge.

$32.00

*****

LOT #2

ATARI 1050 (127K) DISK DRIVE, with power supply and Molex
connector cable.

$37.00

*****

LOT #3

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

$22.00

*****

LOT #4

ATARI 410 PROGRAM RECORDER, with built-in power cord and Molex
connector cable.

This item has not been tested.

$ 4.00

*****

LOT #5

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 9.00

*****

LOT #6

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$14.00

*****

LOT #7

EPSON RX-80 PRINTER with built-in power cord.

$24.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first disk-based software item and $1.25 for each additional disk-based software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds, by either check or money order, drawn from a U.S. bank branch. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

548. AUCTION: Ultima/Origin/Infocom games

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-22 00:00:00 UTC
From: bilstein@mail.utexas.edu
Message-ID: <5r1dmn$3ft$3@geraldo.cc.utexas.edu>
Source record: 71554
Cross-posted to: comp.sys.ibm.pc.games.marketplace,rec.games.computer.ultima-dragons,comp.sys.apple2.marketplace,comp.sys.atari.st,comp.sys.cbm,comp.sys.atari.8bit

Welcome to my Ultima/Origin/Infocom auction. I'm getting rid of the last of my classic computer software to make some money for Atari 2600 games and items. If you have any decent Atari 2600 stuff for trade, let me know about it!

Posting to non-marketplace groups will be infrequent, so please e-mail me to get on the update list.

Please read the rules at the bottom. You are accepting the rules by placing a bid.

==========
THE GAMES:
==========

Autoduel (Apple II) w/box, 5.25" disk, ref. card, map <min> $3

HitchHikers Guide to the Galaxy (Atari ST) w/box, button, <min> $1
fluff, brochure, destruct orders, sunglasses, NO DISKS

Leather Goddess of Phobos (IBM PC) Complete <min> $3

Moebius (Apple II) w/box, two 5.25" disks, poster, ref card, <min> $3
book

Plundered Hearts (IBM PC) Complete <min> $3

Ultima IV (Apple II) w/box, two 5.25" disks, reference card, <min> $3
Book of Mystic Wisdom, History of Britannia

Ultima IV (Atari 400/800) w/box, two 5.25" disks, cloth map, <min> $3
The Way of the Avatar, Book of Mystic Wisdom, History of
Britannia, Reference card.

Ultima IV (??) one 5.25" disk only, sides C & D <min> $1

Ultima V (Apple II) w/box, four 5.25" disks, 2 ref cards, <min> $3
Book of Lore, Voyage Diary, catalog

Ultima V (IBM PC) w/box, four 5.25" disks, cloth map, Voyage <min> $3
Diary, Book of Lore, player reference card, quick reference
card, catalog

Ultima: Savage Empire (IBM PC) w/box, map, four 5.25" disks <min> $3

Wishbringer (Apple II) (shrinkwrapped album box) <min> $3

Wishbringer (C64) Complete <min> $3

Zork II (Atari ST) Complete <min> $3

RULEZ**********

1. Auction will last until July 31st, 10:00pm Central time. It will
then proceed to a once-twice-sold format, with the status changing
every 24 hours when no new bid is received.
2. Minimum bid raise is $1.
3. Conditional bids are accepted.
4. I will e-mail updates daily, as well as updating Newsgroups (some
more often than others).
5. US and Canadian orders only for this auction.
6. Payment must be in US funds, check or Money Order. I may hold a
check up to 10 days, a Money Order will get it shipped in 1-2 days
of receipt of payment.
7. If you would like to get on the update list without yet bidding,
just ask.
8. If you would like to be removed from the update list at any time,
just ask.
9. Buyer pays all shipping, to be determined at the end of the auction.
It will probably be $3 for the first two items, plus .75 per additional
item.
10. References provided on request.
11. If you would like to use an alias, please let me know.
12. I am not an expert on these items, so please ask if something is not clear.
No items are implied, if it isn't listed, it isn't there.

First let me say that I changed the documentation, and its much less
strict than I thought it was. It used to say 'not as part of any compilation',
but I changed it to an 'unaltered ZIP' type thing. I didnt see any ZIP
files in your APE directory in any case.

I aplogize for my slightly off base remarks, and I will post a formal apology
to you. I do however still have some comments about what you have written.

> That is what I am doing.

You are definatly NOT giving away anything. You are selling CDR's full of
pirated ROM images, and shareware, for a large profit. I've seen your post
arguing that your 'charging for your time'.

Charging for 'your time' is pure profit, at least the IRS seems to think so,
I pay a nice fat percentage of all my consulting 'time' to those bums. You
can't include the cost of the CD writer, or computer since your keeping both.

> As far as I know (and I have been made aware of one
> exception), all the emulators on the CD are shareware. I am actually
> doing you a favor by distributing it.

Did you ever stop to consider that distributing shareware along w/ a whole
CDR of pirated software might upset some people?

> I happen to be a registered user of APE.

Thank you of course!

> I got the shareware version of it from a CD similar to the one
> that I have created. I used it, liked it, and paid you for it. I thought

> that some improvements could be made on the CD, so I decided to go ahead
> and make my own - that's how this came into being.

I gave permission for APE to be included on the Pooldisk CD, so I assume
you got it there. Did you get permission to duplicate parts of the
Pooldisk for profit?

> I have arranged things on the CD to make things easier on the APE user.
> I'm sorry if I have offended people by offering the files on this CD,
> but I don't see
> the difference between having the same files available for download and
> having a CD available for the convenience of people who'd rather not go
> through all the trouble.

It's not difficult to candy coat your profiteering, but it still tastes bad to
alot of people.

> I thought that was exactly what I was doing. I am a huge supporter of
> the Atari 8-bit computers and videogame systems. I maintain a web page
> dedicated to them and am constantly helping fellow users out with them.
> I'm sorry if some find this offensive.

Sell the CD's for the cost of the blanks then, and eliminate all the pirated
software.

[sig deleted]

> (Is what you're doing really that much different from what I'm doing?)

If I was selling $50 CDR's full of pirated software then I guess it would be
similar.

I had/have to intention of making a holy war out of it, just my 0.02 on
rom profiteering. I've had the same arguments w/ the multi-cart people, so
its nothing personal :)

> I was completely unsuccessful in getting the two to communicate.
> Do I have to load an R: handler on the ATari, or is this not
> needed when using the MIO?

Ehm.... If you get bobterm started well, you don't need (bobterm doesn't get into his terminal mode if youd didn't load an R: handler.

* did you check the baud rates? Both programms must be on the same baud rate, with a max of 19200 baud
* switch OFF the HARDWARE FLOW control (I'm not sure the MIO has it... but the Black Box does... and I can't null-modem with the HARDWARE flow control)

Then it should work!

Do you own a SIO2PC cable? You can use your sio2pc as nullmodem cable by switching OFF your MIO R: port, booting your XL again, and load the RVERTER driver (from BOBTERM). Then start bobterm, switch to 19200 baud and TADAA you got a very stable nullmodem system.

Ofcoz I agree with you! I Don't like the providing of pirated software
either.... but I looked into your APE-package.... and look: PIRATED
software as well!!!!!!!!!

You packed KARATEKA.PRO and more....

KARATEKA = (c) opyrighted, COMMERCIAL and evereything more BUT sure it
isn't PD or SHAREWARE....

so IF you are praying the (c)omputer laws; first look into your own
stuff....

I'm in the process of rearranging the entire archive right now. I just might put everything into ARC format. The intel utility ARCE40G.COM works great for extracting arc files made with pkarc and superarc.

A couple of years ago I made an a8 utility in mac/65 that will take any ATR and convert it to a real floppy disk. At the time that I made it, I didn't have a floppy drive capable of enhanced density, and I wasn't sure if it would work in that density. I've found out since then that it works great in both single and enhanced density. Find it at:
ftp://closertohome.dyn.ml.org/ftp/pub/Atari_8bit/CTH_Shareware/ATR2DISK.ARC

Cowpoke,
On Bobterm first set the baud to 19200, set translation ti ASCII. On the PC set PCRM+ to 19200 and ascii. On Bobterm, select the go on line host mode (F or G I forget. I think it's G) then on on PCRM+ type ATA. I do this all the time and it works beautifully. Just remember that BTM's best x-fet mode is Y-Modem Batch, so use that to move files. SIO2PC/APE is a better way to move files, but use what you have and that works for you. One other thing, the MI/O has a slightly different pinout than the PC, be sure you have an Atari modem cable and adaptor in-line with your null-modem cable. That will make all the difference!!!

Hi,

I am interested in .ATR images of all the good old games you can get.
For example, i would like very much to have these games to start :
- Rally Speedway
- Rescue on Fractalus
- Silent Service
- Star Raiders
- F15 Strike Eagle
- Mercenary
- Landscape

- etc

Can anyone get those for me.

Thanks

Paulo

Just remember that the paddles read resistance (setting for capacitor charge time). This
should work as an open line will mean extremely long charge and short to +5v will mean
instant charge time. The values should be 228 (open) and 0 to closed. You might want to
insert a 10K ohm (I think that's the value) in line with the paddle pin and switch, just to
be sure you don't do ant damage. The other pin of the switch is connected to the +5v out
pin (check this, it is either pin 7 or 8. I forget at the moment.)
Ex.
o o o o o
o o o o Port on computer
| | \
[R] | [R] 10K ohm resistor
right mouse +-/-+-/-+ center mouse
(-/- =switch)

> OS/2 DOS from OSS.

Isn't it amazing how EVERY SINGLE POST Terry Ortman makes, he claims he has EVERYTHING in the world, but then he always adds, I HAVE NO TIME FOR ANYONE TO GO THROUGH MY 1000's OF DISK BOXES TO FIND ANYTHING.

Terry if someone is asking for help with software, don't bother to send a message saying how you have something if your not going to follow through with making a copy and sending it, but instead say how you have no time to do it!!!

Perhaps its because Terry is so busy being brought to court by the Postal Service for all the mail fraud charges that have been filed against him for all the non-existent items he sold but never sent out, hmmm, that could be it....

562. Welcome to comp.sys.atari.8bit!

Last-modified: May 24, 1997

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current
mailto:mcurrent@carleton.edu
http://www.faqs.org/faqs/atari-8-bit/faq/

Atari 8-Bit Computers: Vendors and Developers / Michael Current

Welcome to Brian's "What isn't for auction, auction"

a.k.a "Brian blew $900 on a DVD player and needs to make some
cash quick auction."

Everything is here: 7800,5200,Intellivision, Sega Master System,
and a lot of other stuff....something for everyone.

Usual rules:

1. Bid if you intend to buy
2. I reserve the right to do whatever I want in this auction
(such as pull items)
3. Buyouts are happily accepted (make a good offer)
4. Buyer responsible for shipping
5. No COD's. Period.

Here is the stuff:

7800
----
Dig Dug (NIB) $1 min
Donkey kong (NIB) $1 min

5200
----
Pole Position (NIB) $1 min
Mario Bros. (NIB) $1 min
Ball Blazer (NIB) $5 min
Rescue/Fractalus (NIB) $5 min

Magazines
---------
Electronic Games:
March '83, March '84 $5 min (both)

Atari 8-bit:
------------

Atari XE Game System, complete in box,
console, keyboard, joystick, gun, Bug Hunt,
Flight Simulator, manuals.

$25 min

Atari XF551 Disc Drive, cable, power supply
```

$20 min

Atari Cartridge Games (for 8-bit/XE/etc.):

Super Cobra-loose $2 min
Choplifter-loose $2 min (Broderbund)
Blue Max-loose $2 min
Decathalon-loose $2 min
Return of Jedi (NIB) $2 min
Final Legacy (CIB) $3 min
Jungle Hunt (CIB) $3 min
Millipede (C,I) $3 min
Congo Bongo-loose $2 min
Summer Games (CIB) $3 min
Star Raiders II (CIB) $3 min
Barnyard Blaster-loose $3 min
Donkey Kong (CIB) $3 min
Crossbow-loose $3 min
Pengo-loose $3 min
E.T. Phone Home (CIB) $3 min
Ball Blazer (CIB) $3 min
Rescue/Fractalus (CIB) $3 min
Desert Falcon (CIB) $3 min

Disc Games (Atari 8-bit) All complete in box

Kennedy Approach $2 min
Goonies $2 min
Dallas Quest $2 min
Bruce Lee $2 min
Wargames $2 min
Beach Head 1&2 $2 min (also includes Raid over Moscow)
LA Swat/Panther $2 min
Controller $2 min

Sega Master System Games (all complete in box unless noted)

Joe Montana Football $7 min
Wanted (CIB) $7 min
Great Basketball $2 min
Rambo III-cart only $2 min
Double Dragon (CIB) $3 min
Walter Payton Football $7 min
Wonderboy 3 (CIB) $7 min
Slap Shot (CIB) $7 min
Captain Silver (CIB) $7 min
Aztec Adventure (CIB) $3 min
M.J. Moonwalker (CIB) $7 min

Jaguar

Atari Jaguar console, controller (no power supply or t.v. hookup)

$8 min

CD-i

Indecent Proposal (DV) $3 min

3DO

Panasonic FZ-1 3DO system, controller, Wolfenstein 3-D, Crash
and Burn
$40 min

Super Famicom

Dragonball Z-cart only $3 min
Pop'n ???-cart only $3 min
Ninjawarriors Again $3 min

PC-Engine

Dracula X complete $30 min

NES

Arkanoid (w/control) $20 min

Sega Saturn

Blackfire (USA) $5 min

-the following are Japanese Sega Saturn Games-

Daytona USA $5 min
Clockwork Knight $5 min
Myst $3 min
Virtua Fighter $3 min
Deadalus $3 min
Haunted House $3 min

Playstation

Warhawk-disc only $3 min
Sampler #2 $2 min

Genesis

Wiz n' Liz, Jordan vs. Bird, Cliffhanger all loose
$3 min (all carts)

SNES

Mario Paint-loose $2 min
Bill Lambair Basketball $2 min (loose)

Intellivision

Intellivision system, complete in box, never plugged in,
comes with brand new Burgertime
$10 min

AMIGA

Bundle deal:

Lost Patrol, Leisure Suit Larry, It Came from the Desert,
Lords of the Rising Sun, Barbarian, Rocket Ranger

all complete in box with instructions

$5 min

MISC. STUFF

Collector Cards/Stickers/Gum ages old:

Donkey Kong 2 boxes
approx. 45 packs $8 min

Video City 2 boxes
approx. 50 packs $8 min

Super Pac-Man box only $1 min

Big Box o'cards, shoebox size, weighs almost 3 pounds, comes with
the following (don't e-mail me for exact count, too many of them):

tons of Dragons Lair stickers and rub offs
tons of Super Pac Man cards and rub offs
enough Video City cards and rub offs
tons of Pac-Man cards and rub offs
a few Ms. Pac Man cards and rub offs

*tons= at least 75 cards (although 100 is probably more accurate)

$10 min

I don't _sell_ the included images for $50 a pop. Try forming a rational chain
of thought next time.

I have never heard of this ass-kicker (?) demo.. then again the newest Atari 8bit material I have seen in 1993 stuff. Will it run under XLIT 0.20? :) <grin> or do I have to fire up my old 800Xl to see it..

also if it is created in Europe it might not run properly under a North American Atari..

Alan
(but I am curious to see new and interesting Atari 8bit programs, a friend of mine told me ZIP, Zmodem and other goodies were eventually released for the 8bit, and I have seen msgs concerning MOD players for the 8bit.. wow)

I have the Pirate's Treasure CHest along with the Parrot demo disk as well as many other 8bit goodies. I never got a Monkey Wrench cart though. (I guess it would be useless unless you have an Atari 800) heh

Man, all this 8bit stuff blast from the past. I got my first Atari 400 16k back in '84. So its been a good 13 years of Atari for me!

->Why don't you just put them up as
->DCM files so that everyone can use
->them.
->ATR is about the most useless
->format for distribution that there is.
-
-I agree with you ... Get the ATR2DISK.ARC at :
-closertohome.dyn.ml.org It will turn those ATR files back to
-Atari disk both 90k and 130k formats.
-
-Thanks to TOM HUNT we have a way around those ATR files.
-

The thinking was this - the atr's are all zipped now, and theres no zip for the 8 bit, and arc comes in too many flavors. Therefore, the reasoning was: even people w/ 8 bits on the net also have some other form of access, and so can convert zip->atr->dcm and xfer to their 8 bit's or use sio2pc cables.
I did ASK in the newsgroup for input on this issue. It was decided to use ATR so that a checksum could be entered and used by APE....
As I dont use real atari drives for anything but putting the software in archive format on my pc, I use ATR exclusively anyhow.

Other sites (maybe that mirror site?) are free to put them up in dcm's. I dont have the time anymore to run the archive full time and have in fact not touched it for about 4 months.

Karateka has been out of print since 1987, thats 10 years..
The Company that published it has no plans for releasing a 10 year old
program . Like the 3000 other classic Atari programs there just DEAD
SOFTWARE . Nobody care about 10 year old programs besides someone that
just picked up a XL or XE at a thrift store for $5.00
I dont think you can Pirate DEAD Software.

BULLETIN FROM JEFFREY G. HAMMER, MIST SHOW CO-ORGANIZER:

It's almost here! Don't miss it! Possibly the last Atari Show
in the United States!

Saturday, July 26th, from 10 am til 3 pm. (Chicago time)
Post Road Community Center
1313 S. Post Road (south of Washington St., US-40)
Indianapolis, Indiana, USA
Admission: $1

Vendor/User Group/Seller list:

This is a list of vendors that have confirmed they are coming
to the show. (We are SOLD OUT.)

Nashville Atari user Group
Emulators, Inc (Derek Mihocka)
FMH Games
LCACE
ACORN - R. Magdich
LAG
ICD
Doug Palmer
It's All Relative
Systems for Tomorrow
SCAT
Donald Turnock
chro_MAGIC / Crawly Crypt
Sanjay Parker
Chris Danyi
Tom Tolman
TOTAL: 24 tables plus MIST plus Jaguar

NOTES:

Missionware will not be there. There may be software available.

Clear Thinking (Edit Plus - Craig Harvey) will not be there.
There will be software updates available.

Toad most likely will not be there.

ICD will run networked Jags, with Battlesphere. He will also
have a limited number of another Jag network game available for

sale. (made by another vendor)

There are plenty of ads on this newsgroup for 8-bit stuff. If you read
the messages for a week or two you'll find what you're looking for.
Common cartridges can be found for a dollar or two, and disk drives can be
found for $10 to $15 for single density, $15 to $20 for double density.
Sometimes bargains can be found for less than that.

I found the Monkey Wrench useful in Basic programming but
unfortunately I don't have an 800 set up anymore! Is there such a thing
as a handler program that could be run on an XL/XE to tell it to treat the
memory locations so that the right-cartridge-slot Monkey Wrench could be
used with the built-in Basic?!?

->Actually that sounds about right for the place I bought Atari stuff from.
->disk drive=$70

I've attempted to delete all your crosspostings outside of the 8-bit group. I agree with Sam Ismail's reply to the original seller's posting, namely that the whole bunch of stuff that was offered would be more appropriately priced at $30 if the seller wants it "priced to sell." On the other hand, if that seller wants to wait years and years, either for some sucker to come along or for somebody who's had a hardware breakdown and is desperate, then that seller can stick with the $130 price tag. These days $130 can buy a supposedly "old and obsolete" 386 IBM-compatible system, so it's hardly a great deal for an 8-bit.

Why do you use the past tense "bought"? What's relevant is current market prices, based on current demand, not prices charged by stores in past years. Today $70 for a *used* disk drive is way too high. (Unless we're talking about Portland, Oregon, again -- in which case $70 would apparently be way too low!)

Chuck,
Digging through my old issues of ANALOG Magazine last night, I found
the answer to one of your questions.

At the BASIC Ready prompt, type ?PEEK(43234)

You'll see 162 if you have Revision A, 96 for Rev. B, or 34 for Rev.C.

Actually, you might be able to tell just by looking at the cart.
Rev.A has the 70's brown look, and Rev.C is silver striped. As far as
I know, Rev.B was the on-board ROM in all the XL machines (and maybe
some of the XE models, though I think most shipped with Rev.C).

Thanks go to Allan Frink of Lino Lakes, MN for his Reader Comment
letter with that answer from December of 1984!

There was a version released for the XL machines that piggybacked the
on-board BASIC. You might try to find someone who'll sell the MWII XL
version to you. Unfortunately, I don't know of anyone :-(

Yes, I've already been corrected...the 400 only had ONE cart slot, so
the MWII couldn't possibly work on it.

Again, anybody out there know if this Pirate's Treasure Chest is
public domain?

Steven

He's gotta be kidding. I bought a 1040ST, plus color monitor, plus
floppy drive, plus a ton of software from the neighbor's gar(b)age
sale for $35. STs it seems are even less wanted than the 8-bit.

> does anyone know of a textprocessor that uses the 80 columns of a XEP-80?

I own the only two of 'em I know of:

AtariWriter 80, by Atari

TurboWord, by Micromiser

I bought TurboWord first, never able to enjoy it. It has a lot of neat features, but the editor itself is just too slow.

Then AtariWriter 80 finally came out so I bought that. I used AtariWriter 80 all the time for years. It's not as rock-solid and full-featured as, say, my all-time favorite 8-bit word processor Letter Perfect, but it does the job. Besides obviously looking nice on the XEP80, it supports 128K RAM for long files, and I was even able to make it run under SpartaDOS X so I could take advantage of my XF551's DS/DD 360K per disk support.

593. Lots of Atari Stuff(2)

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-23 00:00:00 UTC
From: Brian Costello <bcostell@isd.net>
Message-ID: <01bc9786$a0fa47a0$90fa9cce@best-p-75-ever->
Source record: 71512

Sorry to post this again, I accidentally hit post the first time.
Anyway, my dad and I are selling ALL this Atari stuff:

Games

----Cartridges-----

-(3) donkey kong

-reactor

-frogger

-alien ambush

-missile command

-twerps

-ms. pac man

-food fight

-star raider

-dig dug

-asteroids

-super breakout

-----On Disk-----

-exodus ultima 3

-match racer

-pole position

-wheel of fortune

-Sublogic flight simulator

-flight landing simulator

*****Misc-********* -over 34 SPACE(Saint Paul Atari Enthusiasts) disk of the months, w/ utils, games, graphics, SPACE is still active and has lots of stuff availabe for cheap. Ask for more info. Also over 30 blank disks, disk filers(storage boxes) and cables.

Magazines

-30 issues of ANALOG, ---13 of atari explorer, ---29 of ANTIC,

********Poductivity software**********

-Broderbund SYN-calc(2 copies) SYN file+, SYN chron, SYN trend

-File writer- automatically codes in basic

-home financial management(tape)

-Financial cookbook

-advanced calculator program

-atari writer

-MS BASIC 2

-VisaCalc

-bond analysis

-Print shop, and PS companion -cardware(cardmaker)

-B-graph

-atari basic 1

**********educational/graphics**********

-Delta Drawing

-epyx fun w/ art

-the graphic magician

-picture painter

-typing tutor

-atari education system

-programming in basic - Basic socialology

- US government

-intro to sound

-joystick sketch pad

-turtle tracks programming

*******HARDWARE****** (MOST HARDWARE IS IN ORIGINAL BOXES(!!))

1- 130XE

1-800XL w/ 256 k memory

2-other 800XL's

3-1050 drives

2-1020 4 color printer/plotters

2- 850 interface modules(multiple serial and parrellel ports)

2- parrellel interface cables

2-AMDEX color 13.5 inch monitors w/ RCA a/v inputs(For TV/VCR/camcorder and Atari hook-ups)

1 epson lx-86 9DM printer w/ tractor and sheet feeder, printer stand

MANY extra power supplies

1- atari XM 301 modem,

1 panasonic acoustic modem,

1 racal-vadic modem,

1 multitech modem

2- 1010 cassette players/recorders

5- joysticks

1- 2-player paddle controllers

1 trackball

MANUALS FOR ALL HARDWARE INCLUDED, BOXES, INSTRUCTIONS FOR MANY GAMES, MANY TECHNICAL ARTICLES**

*****BOOKS-********

-3 visicalc books

-atari for kids 8-80

-ANALOG compedendum w/disk

-Computes best of atari w/disk

-3 atari software guides

-4 Atari basic programming guides

I own the only two of 'em I know of:

AtariWriter 80, by Atari

TurboWord, by Micromiser

I wrote an emacs subset for the xep80 years ago. Screen even looks like real emacs. Nice and fast, supports multiple buffers. Only downside is that all the current buffers need to reside in the 32K of free memory. OK OK the other downside is you can only display one buffer at a time.

Unfortunately I am cleaning my basement and just put the system away. If there's enough interest, I could set it up again and make a zip of the exe and the sources (it's in AMAC).

Textured wallpaper is not too easy. If I just tacked it into the
Agdagon code, it would become real obvious what cheats I made in
graphics to make it run so fast.

I'll poke through my code to decide how easily the "core" of networking
stuff can be removed, so others could play with it.

> Peaches; The Stranglers

You're correct, the Rev. C peek DOES report 234, NOT 34, as I originally posted. However, the original letter in ANALOG says it should be 34, which makes it a 13-year old typo. I should have tested it myself before I posted.

Here's a quip from that letter that you may find interesting:

"Revision A is the cartridge that came with the Atari 800 or was purchased for the Atari 400. Revision B is the built-in BASIC for the Atari 600XL or 800XL. Revision C is a new cartridge that can be obtained from Atari Customer Relations at a cost of $15."*

I have a note in my magazine that I ordered that cart on 12-7-84. I don't have any history on what machines had which revisions installed after that date.

*Thanks again to Allan Frink of Lino Lakes, MN for his letter in December of 1984 (hey, I give credit where I can!)

608. APE Distribution Terms Ammendum

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-24 00:00:00 UTC
From: ai123@FreeNet.Carleton.CA
Message-ID: <5r6qfi$emt@freenet-news.carleton.ca>
Source record: 71428

Due to abuse by bottom-feeders, the following terms are ammended to the
APE distribution terms. They are effective to all sales as of 12:01am EST,
July 24th, 1997.

I know it sounds draconian, but I just don't feel APE should be used as
a guide program or sales tool for warez CD's.

Added terms follow:

Without my written permission, no version of APE, past or present, may be
included on any CDROM or other software compilation that is intended for sale,
with or without profit to the seller.

The shareware version of APE may not be sold for any amount, except a media
charge not to exceed $5 US, without my written permission. The registered
version may never be distributed in any form, and any licences received are
non-transferable.

Written permission can be obtained only by submitting your request along with
your product content listing, and sale price to:

Steven Tucker
9731 Sunrise M-33
North Royalton, Ohio 44133

The shareware version of APE may continue to be freely distributed between
private parties without charge (including personal web pages), and by
online archives and BBS systems, without charge.

>Due to abuse by bottom-feeders...

I don't really want to enter into yet another useless Usenet pissing contest, but I fell compelled to make an observation here...

You have made several posts to the effect that the individual who has advertised the Atari CD collection is profiting by the unauthorized use of the shareware version of your program.

You have also alluded to "pirated software" a couple of times. But let's face it - the only reason your full-version APE utility is marketable is because of the vast wealth of "warez" games out there. Or do you really think that people are going to shell out $100 for a cable and software so that they can use Atari programs they already own and want to transfer to their PCs? That's ridiculous. The one great attraction for purchasing your system is that the 8-bit owner can now access the online program archives (or CD collections) and use the software that he or she once wanted but could never afford or find. With your cable, practically everything ever published for the Atari is now available. Your sales are directly related to the availability of pirated software on the Net. Does that make you a bottom-feeder too?

>I know it sounds draconian, but I just don't feel APE should be used as
> a guide program or sales tool for warez CD's.

And this raises another point. It is the applications and games archve on this CD that is it's selling point - not your shareware utility, or even the utilities genre in general, which anyone can download for free. Frankly if he hasn't burned off a bunch of copies he should just take your program off. Or all of the utility/emulator programs for that matter. It wouldn't hurt the potential sales of this CD one iota. But it seems to me that you should be happy that your shareware is included for distribution with this CD - I thought that's what the shareware concept was all about - getting the teaser version to as many people as possible in hopes that it will generate as many registrations as possible.

And what if he would have asked permission from you to include it on the CD. Would you have denied him, or asked him for a cut of the profits? He would simply have left your program off and you wouldn't have got anything anyway and you would also be missing out on at least one distribution channel for your shareware.

So the bottom line it seems to me is that your shareware program is simply not fueling whatever sales demand there might be for this

program, so any profit he might be making is not as a result of your work.

And let's be honest - you yourself are relying on that evil, nasty ol' "pirated software" to make a buck too.

Dave B.

I'd be interested in your evaluation of Eastern Front as a war game.
I did not do well the one time I got to play it. It seemed very
sophisticated (not in graphics, but in tactics and realistic
representation of the problems the Germans faced).

I believe the docs for the game explained how trying to take Russia
was a losing cause -- with the weather/seasons, supplies, distances
involved, etc.

The best I could ever do was to break a few holes in the line and just
barely manage to get one or two units to Moscow. But eventually, more
and more Soviet troops dribbled in and I never was able to take the
city before being totally decimated.

I thought it meant I could use a PC hard drive instead of trying to buy Atari 8-bit compatible peripherals that probably won't work long, anyway.

>Or do you really think that people are going to shell out $100 for a >cable and software so that they can use Atari programs they already >own and want to transfer to their PCs? That's ridiculous.

No, that's reasonable. I have about 150 disks of stuff I bought and things I typed in from magazines and programs I wrote, too.

>The one
>great attraction for purchasing your system is that the 8-bit owner >can now access the online program archives (or CD collections) and use >the software that he or she once wanted but could never afford or >find.

It's not "The One" great attraction. Just not having to use flaky 8-bit drives, etc. is Another Great attraction.

>With your cable, practically everything ever published for the >Atari is now available.

And? With a 4x4 truck and a good chain practically all the money in the ATM on the corner is available to me. It doesn't mean I am expected to use the truck in that way.

>Your sales are directly related to the >availability of pirated software on the Net.

That is your assumption, perhaps because you are a pirate?

>>I know it sounds draconian, but I just don't feel APE should be used as
>> a guide program or sales tool for warez CD's.

>And this raises another point. It is the applications and games archve
>on this CD that is it's selling point - not your shareware utility, or
>even the utilities genre in general, which anyone can download for
>free.

Nearly everything on the CD is available for download from somewhere,
so in following your logic, there's no selling point at all for the CD
since everything on it can be found elsewhere.

[snip]

>And what if he would have asked permission from you to include it on
>the CD. Would you have denied him, or asked him for a cut of the
>profits? He would simply have left your program off and you wouldn't
>have got anything anyway and you would also be missing out on at least
>one distribution channel for your shareware.

But if, as you suggest below, nobody is interested in his shareware
utility then he's not missing out on anything if the program is not
distributed on that CD.

>So the bottom line it seems to me is that your shareware program is
>simply not fueling whatever sales demand there might be for this
>program, so any profit he might be making is not as a result of your
>work.

That his program or the utilities in general are not fueling sales is
is completely your assumption. Take a poll of all the buyers of the
CD to find out what programs on the disc they are most interested in
using.

If the utilities were removed from the CD I (and certainly others)
would recognize it as having substantially reduced value.

He's also asking more for a CD full of old 8-bit software than I paid
for two commercial CDs full of postscript fonts and a commercial CD
full of 10,000 clip arts. $50 might be reasonable if he had licensing
agreements with some shareware authors to include registered versions
of the program on the CD.

>And let's be honest - you yourself are relying on that evil, nasty ol'
>"pirated software" to make a buck too.

I think he's relying on the fact that authentic Atari peripherals are
old, slow, and slowly dying off one by one and Atari 8-bit enthusiasts
would find it more convenient to host files on a more modern computer
and get themselves some faster I/O to boot.

If only there was an Amiga version of APE. :-)

>expected to use the truck in that way.

True, but what if you knew that you could take the money with absolutely no chance of ever getting caught or punished - which is the situation with the program archives on the Net. If you purchase the cable and download all of the software or use a warez CD nobody will bother you one way or the other. That's the thing about software piracy - there is no accountability for the user. Or for utility designers who produce products which allow people to make use of pirated software.

>>>Your sales are directly related to the
>>availability of pirated software on the Net.
>
Do you mean to tell me that you are an 8-bit Atari fan and you have never downloaded a game or application from one of the archives, or that you haven't tried using downloaded games with some of the emulators? I don't believe it. And I also don't believe that the majority of the people who would buy the APE interface would do so with entirely altruistic intentions to just use their PCs to back up their old Atari software. That's pretty naive.

>>>I know it sounds draconian, but I just don't feel APE should be used as
>>> a guide program or sales tool for warez CD's.

>Nearly everything on the CD is available for download from somewhere,
>so in following your logic, there's no selling point at all for the CD
>since everything on it can be found elsewhere.

The appeal of a CD full of programs is in it's archival quality. It's nothing to download utilities - every single utility available for Atari 8-bits on the Net could probably be downloaded in the space of an hour and probably use up less than 5 megs total. But downloading Yogi's or the Closer inventories would take a long, long time and take up quite a few megs on the harddisk, nevermind trying to back up all

of that info onto floppies. That's the attraction of a CD archive. No download time and no harddisk megs used up - but you still have all of the important info at your fingertips.

>>And what if he would have asked permission from you to include it on
>>the CD. Would you have denied him, or asked him for a cut of the

>distributed on that CD.

I didn't say nobody was interested in his utility. I said its inclusion in this collection was not a reason that people would decide or not decide to pay for this CD, and that is true.

>>>So the bottom line it seems to me is that your shareware program is
>>simply not fueling whatever sales demand there might be for this

Absolutely. Take your poll. The opportunity to conveniently archive all of the games and apps are what makes this CD marketable - not the inclusion of exclusion of a few utility programs.

>If the utilities were removed from the CD I (and certainly others)
>would recognize it as having substantially reduced value.

Nuts.

peter@soemtron.sb.sub.de (Thomas Havemeister) said:-

>'S' means systems on or off not shield!

Right. I believe the recovery of downed pilots goes something like this:

1) Locate flashing pilot icon-wait till its at the narrowest part of your
radar-going "beep-beep-beep" quite madly...
2) Press "L" to land...
3) Press "S" to turn Systems off (don't know if this is necessary)
4) The pilot will run to you if you are close enough, if not you will be
told... Press "A" to open the Airlock...if you don't open the Airlock
by the time the pilot gets there, he will bang on your hull-cute! ;)
5) Close Airlock once pilot is aboard-reverse procedures, and press
<option> to take back off...

Hope this helps...! Its a great game by the way...Oh watch out for some of
those pilots-sometimes they are not all that they seem to be...! <smile>

Whilst reading the rubbish I usually find here, George F. Hardy wrote somet=
hing interesting about "Eastern Front"

Hello George,

GFH> I'd be interested in your evaluation of Eastern Front as a war game.=
I

One that that struck me as odd at the time: The game originates for the
USA, so why is the player forced into being the AXIS power, rather than one
of the Allies? Perhaps it has to do with America's hatred of communism.

(Please note: This is just idle curiosity, and is not intended to start a
flame war)

GFH> did not do well the one time I got to play it. It seemed very

Nor me. I could take Moscow on the easiest level of the game, but that was
by sending a couple of units there. On the more challenging levels,
strategy becomes far more important. Of course, we know that Germany lost
anyway, so the game stacks the odds in favour of the Russians.

GFH> sophisticated (not in graphics, but in tactics and realistic
GFH> representation of the problems the Germans faced).

It certainly had a fair bit going for it, I think. It's some years since
I've played now, but lines of supply, etc. stick in my mind.

The thing is, EF is the only war game I ever played, as I wasn't really a
fan of the genre. I was more your straight text adventure man, so my
opinion probably doesn't count for much as I have nothing to compare it to.

Well, I haven't. Just because you have dulled your conscience to piracy doesn't mean the rest of the world wallows with you.

Besides, I just got my 8-bit stuff dug out of the attic and another co-worker (and former 8-bit enthusiast) and I are going to spend the next (ummm) indeterminate number of weeks/months/whatever getting my stuff moved from bit-rotting floppies and cassettes to a PC.

>And I also don't believe that the
>majority of the people who would buy the APE interface would do so
>with entirely altruistic intentions to just use their PCs to back up
>their old Atari software. That's pretty naive.

I have just about all the software I need, and my bent toward the Atari is coding anyway, so I don't need to sponge stolen stuff from friends, the net, CDs, whatever.

People are interested in it or they are not. If they are interested,
then it becomes a reason for them to buy the CD, thus a selling point.
If they are not then it it just wasted space. Don't contradict
yourself.

>>>>So the bottom line it seems to me is that your shareware program is

POKES and PEEKS are basic statements, that let you work with the real HEART
of your computer.

Those instructions are very complex and it's hard to explain in one, two,
three senctences how they work.

With POKE you can input a value in an allocated memory adress, with PEEK
you can read it out (not ALL memory adresses can you actually read out...)

memory adress 710 is screen colour

color 0 = black

pokey 710,0 (put 0 into adress 710) makes the screen black

try this: setcolour 2,4,6
a = peek (710)
print a

and TADAA you can read out this colour register.

You should get a great book like MAPPING THE ATARI.

I have some documentation anywhere here... (3 files)... if i find them i'll
mail them to you.

Succes with it.

Marius

You won't get it to work. You have two options.

(1) Run 'Behind Jaggi Lines' and have the keys working with the mountain
ranges all screwed up

or...

(2) Run 'Rescue on Fractalus' with the correct mountain ranges, but no
response from the keyboard.

If you wan't me to read any response from you, do not respond here, Direct all responses in E-Mail to: bensmith@teleport.com

I've added more Items to my Catalogs, such as several large boxes full of Atari ST Software. All of them Complete in Boxes with Documentation. Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari Laser Printer. For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk Drive and Lots of 8 Bit Disk SoftWare for $5 each.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP.

This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. Okay, I dug up the tape. It was filmed in 1984. Atari computers were
fairly popular in England at that time. There was no count-down timer, but
the map of the cave *could* be an Atari display. The characters on-screen
look short and squat like graphics mode 2 text, and they appear to be the
familiar character shapes (mostly numbers). The display uses 6 colors, so
it would have to be done with display interupts, but the layout, which is
divided into horizontal sections, is consistent with that. On the other
hand, I'm not familiar with the graphics capabilities of the computers you
mention. So... possible, but hard to say for sure.... Guess I'll have to
contact the BBC. ;-)

The Axiom can be used with or without a power supply. It has jumpers inside.

Hook it up if it works then the jumpers are set for computer power, will not work on a 1200XL unless the 1200 has been modified to supply power to the port.

>Nevertheless, I disagree with your characterization of the real Atari
>hardware as being flaky and shabby and so on.

Unfortunately, that is the reality of 17 year old mechanical
components. Things break. There are no Atari-authorized service
centers in most people's neighborhoods.

But as Atari hardware in general goes (and the computers specifically)
I've found Atari equipment has always been much more reliable than C64
stuff which my friends were constantly having repaired even when they
were new.

>If you bought cheap stuff
>back in the golden age and encountered disk errors and your hardware broke
>down, that's because you bought cheap stuff.

No, that's because mechanical things break. It is a statistical
certainty.

>I went the high quality
>route from Day One and *never* had any such problems!

Pick one:

A) You're just plain lucky.

or

B) God loves you.

>And from everything
>I've seen on this newsgroup in the last couple of years (i.e., all the
>moaning and groaning about emulation), it seems that running 8-bit
>software on the real thing is vastly superior to trying to use emulators.

The Atari 8-bit has the most sophisticated hardware in it of any
8-computer which probably explains why emulators are only now able to
efficiently handle things like DLIs.

> If you want to avoid the "flaky" problems, my advice is:

> * Use high-quality disk drives, not cheapies. (Better drives also
>have the benefits of additional features and options.)

Too bad there isn't an Atari store on my corner selling new Atari
drives.

> * Don't try to use disks over what they're rated for. For example,
>don't use the second side on single-side-rated disks.

Never did. I even used double density disks as single density,
because by the time I got my first floppy drive, the single density PC
5 1/4 floppy drives were gone.

>* Store disks in pristine atmospheric conditions. Disks stored in a
>dusty or dank basement, for example, will make the heads dirty and cause
>read/write errors. (As I found out when I obtained a collection from
>somebody else a few years ago.)

Recorded data stored on floppies in even pristine environmental
conditions will fail over time.

>* Forget "warp" speeds. DOS programs that require read/write routines
>to pass checksums may be slower but they're more reliable.

Now, how do all of your points keep printers, drive motors, all the
mechanical moving parts in your peripherals from breaking over time?

But ... your ammended license can ONLY apply to future versions and
distributions of software from you ... if I CURRENTLY download a
previously released version, with the previous license, than that
previous license is what applies .. you cannot change it once
the software is released to the public (you can't put the genie
back in the bottle). So it cannot affect or apply to the version
being distributed on the CD in question.

As an aside, I definitely agree the CD is vastly overpriced. 15-20
dollars would be more like a fair market price .. heck for $10
I would be tempted to blow a CD of the archives I've archived
on my hard drive (umich, yogi, yoshi .. something else??) which
only total way less than 100 megs in raw form. Not that I am
offering at this time ... but if I was a bit more organized
I might (say after I get things into a form that I want to
archive onto CD). But CDR blanks are down to $4 each or less.

More to the point, it is hard to sell anything priced over $25 to
the Atari community from the gist of posts I've read here. After
all, systems are commonly available with boxes of software for $30 or so.
As a business person, I would be more interested in selling 50 CDs
at $15 than less than 10 at $50. But then, I'm not in that business.

The first three letters (BPA) are the owner of the FCC registration.
The second three letters (72R and 7YJ) are the manufacturer. The
numbers after these six letters are assigned by the applicant, who
may be the owner or the manufacturer.

I don't know. Look at anything that constituted progress in society, and you'll find that people use it as intended and also not as intended. Sometimes a discovery is brought to light simply because it's a discovery, and enhances our understanding of nature or technology. No motive of good or evil can be assumed on the part of the discoverer or inventor.

You can't be blamed if people take a tool that was intended for personal archival copying and turn it into a way to pirate software. You also can't be responsible for how people view your work.

More or less holy than Amiga people who have experienced the same sort of piracy problems.

>I dunno - let's ask Kenneth to respond.

Oooooers, I'm reguarded as an authority? :-)

Perhaps it is because piracy on the 8-bits was blatant, rampant, and utterly dwarfed the piracy on the C64, et. al. platforms despite the larger installed base of other computers. Perhaps it is because this activity relegated the 8-bit Atari, a superior platform, to the "dead and unsupported" pile well before other lesser computers.

In the early 80s I knew several people who had hundreds of disks of software and not a single one was paid for. I knew people who would even burn their own eeproms, just so they could have carts without buying them. (At least the Mil-Atari user group I attended had the good sense to forbid that activity during meetings.)

If you download something from the net that was commercial/non-pd software you should find out who owns the copyright and make every attempt to contact them about purchasing it. If the company or individual no longer cares, then it is fine to use it for free. But if you don't make the honest attempt to acquire the legitimate rights to use the software then it is just as dishonest as it was to steal the program when it was on the shelf in a store 15 years ago.

Maybe if all the aging pirates out there actually invested as much time in tracking down copyrights and determining the exact state of programs as they did in copying everything in sight then perhaps we could all be happy about copying stuff from the net. Contacting former developers might even pop up new versions of unreleased programs or formally move some commercial programs (maybe even source

code for them) into the public domain.

However, the original issue here is someone charging an exhorbitant amount for a CD containing not just discontinued, out-of-date, and unsupported commercial software, but also currently supported software packaged in a way that violates the distribution license.

Yes, they won't leave their crashed ship until you turn off your
shileds/systems.

Ummm. I don't bother to open the airlock until after I hear the
banging on the hull. In later levels, the nasty-wasty aliens
impersonate the real pilots and try to break through your windshield.
I keep my finger poised to fry them by pressing the S key.

>Kenneth, do you mean to tell me that you consider downloading a game
>like Preppie or Dig Dug from the archives to be a problem of morality?

Not if you pay for it. Do the work to find out who holds the copyrights. As I understand it, the Trameiel's Atari was bought in its entirety by some other company. Technically, Atari does not exist, but the company that bought it should now own all the Atari intellectual property. How about you get those floppy-copying fingers busy making phone calls and writing some letters? Get some documentation from the people involved proving that the software is now considered free.

If I can take $40 from your wallet and you never find out about it I can pretend I didn't do anything wrong. Right?

>Understand - I am not advocating pirating software which would result
>in the loss of royalties or profit from those that deserve them.

You are advocating distributing copyrighted materials and denying the owners their rightful compensations. That is advocating piracy. You justify this by assuming that nobody cares, since you are too lazy to find out if the copyright owners have actually waived their rights.

>That
>is most certainly wrong. But, let's face it, the archived Atari
>software is no longer in any commercial distro channels -

And it will probably get up to 90 degrees in Miami today.

Both facts equally effect the software copyrights. -- Not at all.

>it's not even being made anywhere -

The program is "made" each time it is copied. Copyrights protect the original creator's right to collect compensation from each copy made.

>you can't buy it from the companies who released it.

Here you are assuming things again. Just because you think the producers of software aren't interested in it, doesn't make it so. Do the honest work to find out.

>Are you serious when you suggest that it's wrong to download
>the ROM image of an ancient game like Temple Of Apshai when Epyx
>itself has ceased to exist?

Find out who actually holds the copyrights and ask them what can be
done with the programs. Even if a company is liquidated or sold, some
body somewhere holds the copyrights.

>>Besides, I just got my 8-bit stuff dug out of the attic
[snippity]

>accumulated when Atari and all it's supporting companies were actually
>producing and making royalties - when the idea of Atari piracy had
>real meaning - do you have any copies of pirated software that you
>obtained from friends?

AFAIK, nope. Mostly I bought ROM carts since I didn't have a floppy
drive most of the time, and when I finally did I bought software
development stuff. Occasionally I borrowed a disk or (gasp) a copy
from a friend. If the program was good I bought it. If not the disk
was always more useful reformatted.

>Everybody I knew in my local users group in Texas at the
>time (1985-1990) was. In fact, everybody I knew who had an Atari at
>the time was.

It's probably not safe to brag on an Atari 8-bit newsgroup that you
and your friends are responsible for the premature death of third
party software support for the 8-bits.

I guess I must have hung around a better class of people than you did,
because I do remember people in our 8-bit user group who didn't steal
software.

Didn't your mother ever tell you that just because you think "everyone
else" does it, doesn't make it right?

>Remember all of the Antic and Analog articles about how
>piracy was killing the Atari? Well, they weren't just talking about me
>ya' know.

Ok, not just you. You and your questionably motivated friends.

>So I dispute your claim to speak for the Great Atari Majority.

I don't claim to speak for a majority. I just know the difference
from right and wrong, but I don't rationalize the wrong things I may
do, just so I can feel undeservedly better about myself.

>>Nevermind that a typical person wouldn't care about most of it anyway.
>>It seems pirates are the only ones obsessed with acquiring and
>>distributing a copy of everything that's made.

>Look, as I said above, I used to hang out with Atari users.

No, you described yourself as hanging out with Atari pirates.

>At users
>groups, in the military all over the world, and at college. I flatly
>dispute your claim to say that the "typical person" wouldn't care
>about "most of the software". That absolutely does not characterize
>the hundreds of Atari enthusiasts I met over the years.

If you had the entire Atari 8-bit software library at your fingertips, exactly what percent of the software could you or would you actually use? Probably not more than 25% even if you are an Atari zealot. So, it can be inferred that you quite obviously don't care about the other 75%.

So, why put it on a CD when you don't care about most of it and it is all easily downloadable? A single archive of READ.ME files listing the contents of the ftp archives would be just as useful as the archive itself and it could probably be distributed on a floppy instead of a $50 CD-ROM.

> myself.

Scott,

Someone seems to have decided, that in a fit of egomania, that I
have declared jehad on the archival of 8-bit software. This is a
blatant misrepresentation of what I said, or at best a misunderstanding.

All I suggested in any of my posts is that I didn't want my
software sold on any $50 CDR's, that the people selling them were
profiteering, and I wanted no part of it.

I was not bitching about pirated software, or you, or your
efforts to keep the archive. If I made any suggestion otherwise then
it was a mistake, and I apologize in advance.

> Why is the atari 8 bit community so eager to quash the piracy issue?

There are people who are making it a holy war, and following thier own
moral compass in doing so. It's a bit unfair however, to infer
someones views are to the extreme right, or the extreme left, based on
what are actually unrelated statements.

> C-64 and apple 2 piracy was running rampant (probably due to the

> Why do atari people feel so holier than anyone else about this issue?

I think a more to the point question is what keeps happening to the
archives that people have started? Is that jehad element complaining
that loudly about it? Nobody has said much about it in public.

Yours is the first to last longer than a week.

Steve

How many people are using BASIC/XL or BASIC/XE?

Can you give me the differences between the two?

Is anyone else aware of bugs? (I found out that the Move command of
Basic/XL running on an XL is sometimes unpredictable. Running the
Translator on the XL fixes it, so I think the cart is using something
that conflicts with the OS to do the memory moves.)

Source record: 71386

Didn't see a place where I could jump in that thread and stay dry, so here' s my view on the $50 CD.
The Commodore 8-bit newsgroup has a guy on it frequently named Jim Brian. He has put far more into that community than he has ever taken out of it. He is a DOER, like Steve. Yet some of the watchers are ready to shred him when he states an opinion, and now he is considering leaving that scene, like Steve is this one. We will miss them if they go. We need everyone we have left to stay afloat.
Lots of good points made. I HAVE pirated before, and don't lose sleep at night over it. I REGISTERED my APE, not to pirate, the shareware would do as well, but to reimburse someone who has worked for hours on end to develop a delightful utility.
It would surely burn me as well, if I got nothing from the developement I had worked so hard on, only to have some guy come in and charge a big time price of $50 for the sweat of mine, and other folks brows. More exposure? Tell me the one klutz who will shell out that $50 bucks, but hasn't already heard of APE?.
So it doesn't bother me that Steve has a higher moral standard concerning pirateng of obsolete programs than I do. Just wish we'd all cut him a little slack. Register with any of those developed programs you like, and I'm sure the obsolete pirate Gods will forgive us all.
Thanks. James Lueck.

Yes, that is part of it. The USSR is the enemy. We might have to
try the same thing as the Germans. It (was) is not easy!

Also, for those interested in military history, far more was
available (at the time) from the German than the USSR point of
view.

I knew some players who regularly won. It takes skill and a minimum
of mistakes. And a real adjustment for the attributes of the
Russian soldier. It is hard to wipe out bypassed until. But hey,
that was real. Germany 'faced' over a million active partisans in
the rear areas, which cost over a million Germans to keep in check.

I agree with you Yogi...

The CD collection of Atari stuff is a nice idea to have all the Atari material in one convenient location... but my concern is is not so much with the ancient copyrights. Like does anybody from Siruis Software exist anymore to even care about a 1981 galaxian-clone that stunk anyway??? My concern is distributing the emulators without the original authors consent. I don't know if the author of this $50 CD (that price seems a little on the high side, some thing like $20 or $30 seems respectable), has contacted the emu authors.. those guys are now, 1996, 1997.. you can't just distribute their stuff and make money off of it.. that is what I have a problem with...

Ah, nope. I think I bought the Compute's Book of Atari Graphics
(something like that) and Compute!'s First Book of Atari Games from
someone (maybe you). But Mapping the Atari was the first book I
bought for it back in the deep, dark days or yore.

The Asckicker Demo will only run on a 130 xe with a PAL chip. A North American Atari 130xe with a PAL chip put in will do the trick. Believe me this demo is worth it alone putting your PAL chip in. I use to think "JOYRIDE" was the best demo for the 8-bit until I saw this. It's basically a DOOM clone with the texture on the walls minus the hand with the gun and the monsters.
If somebody had come up with this kind of programming back in the golden age of the 8 bit in the early 80's we would have had a DOOM clone long ago.
But maybe its not too late- Taquart, HARD, Heaven all you guys there in Poland, If you were to come up with such a game, it would be a best seller here in America (among us faithfull 8 bitters) as in mucho money. Take the challenge, make us proud!!>

Source record: 71462
Body handling: Inline uuencoded payload not displayed: Antic - The Atari Resource.url

PEEK and POKE allow a BASIC program to directly access memory contents. If I remember correctly,

A=PEEK(1457) will put the value stored in memory location 1457 decimal into the variable called A

POKE(1457,6) will put the decimal value 8 in memory location 1457 decimal

As far as a list of commands goes, it's not that simple.

You need to know more about how the computer's CPU and hardware work together to understand what you are doing with PEEK and POKE. Languages like BASIC really are just attempts to translate between what the machine does and how a human thinks.

Antic and A.N.A.L.O.G. magazines had good articles explaining the basics of the Atari 8-bits. Antic was the more elementary of the two. I have attached a link to a web project to put issues of that magazine online.

Hope this helps,
Fred Thompson

Or - people who use software that they'd wish they had- nah, people who used to pirate the software when they were "warez dudez" (i.e. teenagers with bad acne like myself) and want to relive that relatively innocent time (I dont think they put you in jail for software piracy at that time if you were under 18).
If I'd have known that other people were going to bitch about pirated 8 bit software for so long on the net I wouldn't have wanted to bring the archive back and collected it all. I would have collected it for myself.
Why is the atari 8 bit community so eager to quash the piracy issue? C-64 and apple 2 piracy was running rampant (probably due to the availability of good emulators 2 years ago, unlike atari emus which only got really good relativly recently). I believe atari software always sold less copies than the same titles on the other platforms, even though most of the apple 2 ones were inferior. The c-64's drive design made that platform VASTLY inferior, IMO.
However, this still doesnt explain why those sites featuring those platforms are so numerous, and ataris weren't. Hell, there was even a Trash 80 software archive in numerous places.

Why do atari people feel so holier than anyone else about this issue?

BTW, $50 is too much for this CD, anyway. It has tons of duplicated software on it. A good ftp client will snag EVERYTHING in the archives from more than 1 location.
Also, he doesnt have any of the polish Yoshi archive in there, a lot of stuff is there that isnt in Jellystone.

As for complaining about the price of ape, you can build your own cable for less than $10 assuming you have an old sio cable to cut up and dont care if it looks pretty in its own box or not. You dont have to register the software if you dont want to write at high speeds to virtual atari disks (which do you really have to? We're just playing some games here)

BTW, how many people here served on the US congressional committee to investigate how many people become violent after playing old pirated

video games and explore their other deviencies because they copyed that file? How many people want to?

How many people think its ridiculous that this happens? Loss of respect for a copyright is not usually a good thing. That means that you probably dont pay your taxes, respect your marriage, protect your children, hell you probably drive to kill.

Atari 8 bit piracy NOW is not going to gouge anyone. I use them as a memory refresher (mostly as a re-cracking exercise) much like a notebook. I collect things (including the actual atari computers 12 at last count) merely to have them and preserve them, along with the software.

just rambling yogi

Poke allow you to change a value for a memory address that controls
a function in the computer. For instance, poke 720,10 will change
the value of location 720 to a 10. poke 720,15 would change it to
a 15, etc.

Peek allow you to look at the values without changing them.

It has been about 15 years since I have programmed one of those things,
so I cannot help you out with any real examples.

> bottom-feeder too?

I'm a bottom feeder for writing a useful utility? No more than PKWARE
is a bottomfeeder for providing a ZIP utility, and responsible for the
PC Warez scene.

If all you see in a product like APE is its ability
to bring you 'more warez more faster' then you are saying more about
yourself than APE.

I never made any objection to the archival of the software, its not my
place to do so. Thats a moral decision on the part of the persons
involved.

My ammendum only restricts the SALE of ape on compilations, thats it. If your
upset about that, too bad. It can still be downloaded FREE from
anywhere on the net.

The only persons the ammendum has any effect on are people selling other
peoples software for money. Period. You sell other peples software
for profit?

>>I know it sounds draconian, but I just don't feel APE should be used as
>> a guide program or sales tool for warez CD's.

>
> And this raises another point. It is the applications and games archve
> on this CD that is it's selling point. - not your shareware utility, or
> even the utilities genre in general, which anyone can download for
> free.

Then why are you pissing yourself over me asking it not be included?

> Frankly if he hasn't burned off a bunch of copies he should just
> take your program off.

Yes, he should. I believe that is the point? Are we having the same
conversation here?

> Or all of the utility/emulator programs for that matter.

What I said has nothing to do with what other people do with thier work. I
never alluded to that and it's frankly not my place or yours to do so.

> It wouldn't hurt the potential sales of this CD one iota.

My point exactly, so whats all the whining about? Its not like they
are doing anyone a favor by including it, except themselves.

> But it seems to me that you should be happy that your shareware is
> included for distribution with this CD - I thought that's what the
> shareware concept was all about - getting the teaser version to as
> many people as possible in hopes that it will generate as many
> registrations as possible.

My program is available free everywhere. I don't want scumbags using it
to sell warez CD's and its well within my rights to say so. I could
care less what you think I should be greatful for.

> And what if he would have asked permission from you to include it on
> the CD. Would you have denied him, or asked him for a cut of the
> profits?

I would have politely asked he not include it, if I had been politely asked
that is, which is all I have requested. You have an objection to
a polite society?

> He would simply have left your program off and you wouldn't
> have got anything anyway and you would also be missing out on at least
> one distribution channel for your shareware.

Since it's freely available to anyone who wants it, the only value of
having it on a $50 illegal pirate CD is to the wallet of the person
selling them.

> So the bottom line it seems to me is that your shareware program is
> simply not fueling whatever sales demand there might be for this
> program, so any profit he might be making is not as a result of your
> work.

Then he does not need an unzipped and ready to run version of my
program on his cd (a violation of the already existing agreement), and
he does not need to advertise it as making his new $50 CD easy to use.

> And let's be honest - you yourself are relying on that evil, nasty ol'
> "pirated software" to make a buck too.

Why people like you use APE has nothing to do w/ why the other segments
the the Atari community use it. I'm sure there are like minded
individuals who will find your 31337 'piracy is helpful' speech
rousing, but I don't believe you speak for the majority.

If APE is popularly viewed as primarily a tool of piracy, then perhaps its
time for me to turn my efforts away from the Atari completely.

I think, ATARI-Writer should work, but S.A.M. is much better. XEP-80 is
also 320x200, good for programmes that use E: as output and are capable
of handling with 80col/line.
MAC-65 on XEP-80 should work fine too :) I am going to try it.

BTW: I remember, there was another (bugfixed?) driver for the XEP-80,
distributed by ABBUC. Does anybody know, what it does?

->buy Atari 8-bit compatible peripherals that probably won't work long,
->anyway.

[putdown #2:]
->... Just not having to use flaky 8-bit drives, etc. is Another Great attraction.

[putdown #3:]
->I think he's relying on the fact that authentic Atari peripherals are
->old, slow, and slowly dying off one by one and Atari 8-bit enthusiasts
->would find it more convenient to host files on a more modern computer
->and get themselves some faster I/O to boot.

On that latter score you're got a point: Real 8-bit hardware is getting older every day (and who isn't?!) which means that maintaining it and finding parts are more difficult as time passes. And it's also true that more modern computers are faster, bigger, and possibly <ha-ha!> even better in some ways.

Nevertheless, I disagree with your characterization of the real Atari hardware as being flaky and shabby and so on. If you bought cheap stuff back in the golden age and encountered disk errors and your hardware broke down, that's because you bought cheap stuff. I went the high quality route from Day One and *never* had any such problems! And from everything I've seen on this newsgroup in the last couple of years (i.e., all the moaning and groaning about emulation), it seems that running 8-bit software on the real thing is vastly superior to trying to use emulators.

If you want to avoid the "flaky" problems, my advice is:

* Use high-quality disk drives, not cheapies. (Better drives also have the benefits of additional features and options.)
* Don't try to use disks over what they're rated for. For example, don't use the second side on single-side-rated disks.
* Store disks in pristine atmospheric conditions. Disks stored in a dusty or dank basement, for example, will make the heads dirty and cause read/write errors. (As I found out when I obtained a collection from somebody else a few years ago.)
* Forget "warp" speeds. DOS programs that require read/write routines to pass checksums may be slower but they're more reliable.

If you can find it, Compute!'s Mapping the Atari gives the layout of
all the 8-bit's memory and registers. It's indispensible.

Actually Yogi, I didn't say this... I was responding to it.

>Why is the atari 8 bit community so eager to quash the piracy issue?

Beats me. I think it is a lot of sanctimonious crap myself. Taking "Preppie" from an 8-bit archive is not the same as searching the warez sites for the full version of Quake. Seems stupid to just let thousands of titles just lay there because "ooohhhh, only bad people use copied software". I don't seek warez from the Net. I register emulators that I want (even if I have downloaded full versions) and I purchase the current software I am interested in. But I do get games from the Atari 8-bit archives because there is a big difference between downloading dead software for a dead computer and swiping the latest version of Duke Nukem or Interstate 76.

Plus, I also think an awful lot of people who bleat about "piracy" in public have dipped their wicks in the archives themselves and aren't being honest about it.

>Why do atari people feel so holier than anyone else about this issue?

I dunno - let's ask Kenneth to respond.

>just rambling yogi

Yogi, you are an Internet god and you're archive is pricless. Your FTP site is more important than the White House's web page. Many, many, many thanks for all the games. Never let it die.

: Greetings from Merida, Yucatan, Mexico (Land of mayans).

Peek reads a number from a memory location and poke stores a number. The numbers read or stored must be between 0 and 255.

Here are some pokes. POKE 731,1 [Return] will silence the click sounds when pressing keyboard keys. POKE 731,0 will return them.

If no keys are pressed for a few minutes the TV screen colors will begin to cycle. This is called the attract mode and protects the TV screen from having the same colors displayed for a long time. POKE 77,128 [Return] will start the attract mode immediately. Within a program POKE 77,0 will turn the attract mode off.

Location 752 controls the screen cursor. Turn the cursor off by typing POKE 752,1. Move the cursor and it should be gone from the screen. To turn it back on type POKE 752,0.

Now for a peek. The computer uses location 53279 to detect if console keys have been pressed. Type this program:

```
10 PRINT PEEK(53279)
20 GOTO 10
```

Type RUN [Return]. You should see a line of 7s on the left side of the screen. Press and hold the OPTION key. The numbers should change to 3. If you press the START key, 6 should be displayed. Other numbers will be displayed if more than one console key is pressed at a time. To stop the program, press the BREAK key.

Page six of memory (locations 1536 to 1791) are unused by BASIC and may be used for poking and peeking without crashing the computer. For example type PRINT PEEK(1536) [Return]. You'll probably have 0 printed to the screen. Now if you POKE 1536,200 and then PEEK(1536), the computer should return 200 which you just stored.

I hope these few examples demonstrate how peek and poke work on your 65XE.

Steve

I dunno about these recommendations... My mom put all my old atari stuff in the basement (which flooded!!) for a few years, and my happy drive still works, the warp speed disks work fine, and almost all of my single sided disks were made double sided with the switch accessory I had put on my 810 drive... that way the disk sleeve isn't damaged... out of a few hundred disks only one or two came up with errors... and they were in pretty bad shape to begin with...

and all my old hardware runs great!!! be interesting to see if this pc works 15 years from now... hee hee...

There were two major sources for the 800XLs, Taiwan and Singapore. There were minor variations in the circuit boards, mainly in the grounding, but other than that they used the exact same electronic circuitry, and schematics between the two will be identical. Because of the minor differences between the two countries (neither is really a redesign), each model probably had to be certified separately.

Just a thought...

There was a cartridge-based system called Diamond GOS that appeared briefly. Also, if memory serves, either Antic or Analog published a similar GUI-type system, but I can't remember the name. The difference between the two: Diamond GOS used a Graphics 8 screen, and the magazine version used a Graphics 0 with I believe a slightly redefined character set, but I'm not certain as I haven't seen it in several years.

Hopefully someone can help clarify? dB^(

Geos evolved into GeoWorks on the PC. Formal support for the PC
version has been transferred to a new company, NewDeal, Inc.
http://www.newdealinc.com/ Support for the C64 version evaporated a
long time ago.

Geoworks http://www.geoworks.com/ continues to concentrate on
developing their multitasking GUI for PDAs and such.

I still have a copy of GeoWorks Pro, because it runs well (real good
multitasking) on terribly obsolete PCs that can't run Windoze 9x.
Also, the other good point is that fact that it is not a Microsoft
product.

Unfortunately, there never was a GEOS for the Atari due to the piracy
deterrent. There was a Diamond OS that I think ran from a cartridge,
but I haven't seen it. Can't say if it was multitasking or not.

My original 48K 800 (which I no longer have) began to act flaky when
it was warm. It was fine only as long as it was in a room with *good*
A/C.

My 48K 400 works fine. My two 800XLs work fine.

My 810 disk drive no longer works. The Xf551 works, but someone
previously posted here that they have notoriously weak SIO
connections, so I am very careful with it.

The 410 tape drive still works, but a metal finger inside has slowly
cut its way through a piece of plastic so now the play/record buttons
won't stay down.

The first 1010 recorder I bought didn't work. Neither did the next
one. I remember reading complaints about them in some of the Atari
magazines. The third one I got worked and still does.

I never had an XE, because all I ever heard was complaints about
reliability and the cruddy keyboards, etc. I played with one in a
store and agree that the keyboard is the shabbiest thing ever stuffed
into an Atari.

I'd never been happy with Atari printers, especially that letter
quality printer (1027?). After getting a P:R: interface I used
several industry standard printers which were always faster, and
produced better output than Atari's.

Basically, the pre-Tramiel Atari was very good at producing very
reliable computers. I recall Antic (or Analog? Creative Computing?)
printed that the out of the box DOA rate on 800XLs was impossibly low
(below 1%) while the coloeco Adam was 22% -- something like that.

Atari was not quite as good with the mechanical peripherals, but still better than the Tramiel Commodore did with the C64. I had 3 friends all with C64s, monitors, and floppy drives. At least one of them had something being fixed all the time. Drives lasted about three months. Computers about nine. Commodore was pretty good at putting together composite monitors. I only saw one of those early Commodore monitors go bad. (In all honesty, though, I have run across people who claim they never had problems with their C64 or peripherals.)

But as time goes on, mechanical things will break. Even electronic things will go belly up. Unless someone can manufacture new 6502s, Antics, Pokeys, etc, and 8-bit motherboards the time will come when there will be no functioning 8-bit hardware.

I have Basic XE, and used to have Basic XL. Basic XE was designed for the 130XE to take advantage of the extra memory. I used it to run Forem XE Pro BBS for several years. Both have extra commands not found in regular Atari BASIC, but the only difference I recall is the extended memory utilization.

A MOVE routine is going to have its problems no matter what language you use if it is not written properly. Basic XL/XE (I may as well include Action!) have a very basic MOVE routine that doesn't check for which way you are moving a block of data. They always start at the first byte and go up to the last. There is no problem with this if you are moving down, but you will run into problems in moving up if the source and destination blocks overlap. The first data will overwrite the last data before the routine has had a chance to move it. I was working on a rewrite of the Action! runtime MOVEBLOCK routine to do the direction checks and act accordingly, start at the bottom when moving down, start at the TOP when moving up.

Gee, I've rambled enough for now, hope this helps.

There are KNOWN BUGS in BASIC XL, 1.00, 1.01, 1.02, and even 1.03 the
last version. I myself have 1.00 and it worked flawlessly, but the
cart is acting up, I also have Basic XE with the latest extensions,
the difference? Basic XE EXTEND Mode, but with the Basic XL Runtime
Pack from OSS, (I'm looking for a copy) it turns Basic XL into Basic
XE with Extend mode....

US Code Title 47, Sec.227(a)(2)(B),a computer/modem/printer meets the definition of a telephone fax machine. By Sec.227(b)(1)(C), it is unlawful to send any unsolicited advertisement to such equipment. By Sec.227(b)(3)(C), a violation of the aforementioned Section is punishable by action to recover actual monetary loss, or $1500, whichever is greater, for each violation.

E-mailing me indicates acceptance of these terms.

Your 800 rams are probley 400ns and should be replaced with faster cooler chips.
Atari tape drives like the Hong Kong 410 had problems but not to had to fix even for a lammer
The XE keyboard was a design flaw with a life exp of 5-10 years.

Funny, Star NET was on-line in Miami from 1989-1996 and I was a DUAG member for years and never herd of you, There are a few Atari user in Miami maybe you guys can setup the DAUG group again.

Dade Atari User Group.

You have a great point there, Durability of the 8bit is oustanding.
My system has been on 24hrs aday since 1989 and its a big system
3 fully upgraded XL's with HD,BB.MIO and a MUX "LAN" network. And its
been surged thousands of times and its still at 100% While on the other
hand I had a 386dx25 last 9 months before it died, and a few 486DXnn ,
none of my PC stuff has last as long as the old 8bit stuff. Atari put
there stuff there some incredible SALT test.
And its still keeps on going..

Goes for the 64 didnot multi-task not even task swap.
I had it years ago for my long gone 64c, it did have some good pionts but it was so incompatible with all commie hardware infact it didnt even support there ramdisk, to be of any good use. Diamond worked like a real GUI but was introduced to late.
The Atari Market was dying in 1986-8 and V3 had its problem.
It took Microsoft 5 versions to get it right.
Plus plenty of money for R&D.

I have Diamond V3 , the 8bit gem on a super cart.
I belive it used a GR.0 screen with several redefine charters set
and it was more or less developed for a floppie based system.
While it dose work with the MIO, Black box and the Multiplexer some weird
bugs have poped up. Antic and Analog both had Graphics GUI like programs
"M-windows" and a few other that had a lot of power but limited in
support. I programed a REAL gem-like clone for the 8bit in 1987-88 that
used the same Icons as Digital Research GEM not the Atari version og GEM.
I had plans of completing the system but started to run a BBS and got side
tracked. However I do thing its time to Start Project "GUI" Such a
project would be developed by Multi-programmers on the Internet in a
colective project.

Define lamer :-) It took me two weeks to build the voice synthesizer
described in Analog. And it tended to act funny. All them little
wirez every where :-)

>The XE keyboard was a design flaw with a life exp of 5-10 years.

Yeah, we were royally Tramieled.

I arrived in Miami in 1993. I didn't have my Atari stuff in storage
down to Miami until 1994. Too busy running the video business (Amiga
hardware) through this year to care about the 8-bit stuff.

I believe TurboBasic had two move commands. One for going up and one for
going down (to handle overlapping regions).

716. Re: Durability of 8 BIT hardware

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-27 00:00:00 UTC
From: Alan Sharkis <ASharkis@postoffice.worldnet.att.net>
Message-ID: <33DBD9ED.4797@postoffice.worldnet.att.net>
Source record: 71341

When I first looked for a computer for my family, after having some mainframe experience and dabbling with the TRS-80s my wife used to bring home from her school for the summer, I addressed all aspects of what was on the market except for hardware durability. I tentatively chose Atari 8-bit for all of those other factors.

Then I talked to some of the people who serviced computers. In one place, the guy took me back to his workroom, where there were several Apple //s, a large stack of Commodores and one Atari 800 that was there for upgrading, not for repair. In another place, the service technician showed me the edge connectors on the C64 and compared them to the connectors on the Ataris and told me that was a good representation of how the two machines were built generally.

That convinced me. I have an 800 in the closet. I take it out every once in a while, and it boots right up. I have an 800XL that I found on the street, discarded. It works like a charm, although it could have been subjected to all kinds of abuse. My 130XE had to have a space bar repaired and joystick sockets resoldered several times when it was only a couple of years old, but has given me no trouble since. No, the keyboard doesn't measure up to the 800's, or the one on my clone for that matter. But the computer keeps humming away.

Disk drives are another story. They have lots of mechanical wear points, dust-colllection sites, etc. I keep them maintained. Even the XF-551 I have gets routine preventive maintenance, although there's less to adjust on it. And the 1050s have never needed more than cleaning and lubrication, and in one case, an adjustment to the eject spring.

I know of PRO BBSs that have been in nearly continuous use for years without problems in the Atari-manufactured hardware.

Still, I know that this happy situation cannot last forever. Many members of my user groups keep extra equipment as spares. I feel that emulation will be important in that regard, as well. And as for the hardware on which those emulators run, well, consider this:

A PC, custom designed with quality parts, went through two hard drives and four mother boards in under two years?

That's not unusual, by the way.

717. 1200XL Video "Fix"

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-27 00:00:00 UTC
From: ogawa@jtcc.com
Message-ID: <ogawa-2707971655130001@pulsar.iav.com>
Source record: 71342

I understand that there is a way to "fix" the video output of the 1200XL which will "tone it down" so that it no longer "overloads" a TV or monitor.

I'd greatly appreciate it if someone could post that fix here or perhaps point me in the right direction.

James

The best such fix is Ben Poehland's Super Video upgrade published in Atari Classics a few years ago. Haven't done it on my 1200XL yet but have done it on several 800XLs and a 600XL and the results are spectacular. It would be nice if Ben were to give permission to put it on the web since this is info every Atari user should have. Anybody know what he's up to these days?

hello All,

I'm on a wonderful trip down memory lane after discovering some Atari Emulators.

I aquired my 1st Atari some 15 years ago (doesn't time fly!), and somehow, somewhere it disappeared.

I am looking now though for the game:

Bounty Bob Strikes back (by Big 5 software??)

I did download it from a site somewhere, but it didn't extract.

Also has anyone got this program to run under any of the emulators available?

any help would be appreciated.

Thanks in advance.

I know this. I believe it is documented in the Basic/XL manual. In
fact, I rely on this documented behavior to coarse scroll text in a
window on a custom display in a few board games I wrote. It works
fine on an 800, but on an XL only parts of the data in the windows
scroll. (Run the Translator OS on the XL and the MOVE works again.)

Interestingly, I have found no other problems moving any other data in
any program even when the source and destination (intentionally)
overlap. It seems there's some bug between printing text and using
the Move command.

727. FS: Commodore 1702 Composite Monitor..$25 (Lower price!)

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-27 00:00:00 UTC
From: Bill Frandsen <bfrandse@rrnet.com>
Message-ID: <01bc9a35$b8637040$46b70bce@pac-man>
Source record: 71424
Cross-posted to: comp.sys.atari.8bit,comp.sys.cbm,rec.games.video.marketplace

LOWER PRICE!

I have for sale a Commodore 1702 Composite Monitor that
works great when connected to any Atari or Commodore home
computers, or any VCR or the newer video game systems.

It has the two front jacks for composite video and audio, as
well as the rear jacks for separate LUMA/CHROMA and audio.

It has been cleaned inside and out, looks in good shape, however
has one minor flaw: It is blurry during the first 10 or so minutes
of being on. After that is is crystal clear for as long as it's left
on. So long as you let it warm up, it looks great--sharper than
most 13" TV's you might have your system connected to.

The picture is bright and full contrast, even with controls set
in the middle (it's not going dim or anything)

The cost is only $25.

Shipping is not included, I can ship via UPS ground,
send me your zipcode so I can quote you the actual cost.
(expect around $15 is my guess due to the weight of the tube)
Shipping to lower 48 US states only, sorry I cannot ship out of country.

Prepayment in the form of money order or personal check.
Mutiple references available upon request.

Thanks in advance!
bfrandse@rrnet.com

I think it's great that you are an Atari enthusiast, however, you take
massive liberties with the truth. I love my 800XL too, but I would
not call the video capabilities on my PC of my Matrox MGA and 3Dfx
Voodoo to be primitive. By the way, Amiga computers are not PC's nor
are they slower than the Atari 8-bits. Same with Macs. What do you
mean Atari's are fastest next to PC's?

wrote:

> Be a hero instead of a pirate.

Why do you assume I am?

> Exactly the point. I don't pirate.

So, you're mad that other people do. You say "here's the solution" and
then post in some sort of righteous indignation when people don't rush out
and do it. You do it if you think it's important.

> (As if having an abortion can actually make you an expert on it, heh.
> And what does your right-to-kill point of view have to do with the
> subject, anyway?)

Well actually I think everyone reading it sees it as a clear analogy for
your standpoint. If you believe in what you say, you should be doing it.
But you're not doing it, even after saying how easy it is, so it basically
suggests you're simply posting without actually believing in your own
posts as strongly as you would have us believe.

> So, because pirates are lazy

That's not it at all, they _don't care_. Can you really not see the
difference?

> I'm supposed to do all the work for them
> to discover who does and doesn't care about the software copyrights?

Yes, if you feel this is a problem, absolutely.

Have you ever blinked your lights at someone on the road to tell them a
cop is around the corner? Anyone done it to you? It's the same thing,
that action is saving someone else from breaking the law. If you _really_
believe that these people are breaking the law, do something so they
aren't.

> If you demonstrate a piece of software to friend you don't owe anyone
> else anything.

If I get payed for demoing it? Hardly.

> The subject was a $50 CD-ROM, not the archive.

Yes, but your messages do not appear to have anything to do with that,
you are condemning all the "piracy" of Atari 8-bit software equally in
your posts. If you have no problem with the archives, you should have

clearly stated this.

> And copyright lisences
> typically do describe that compensation is due for use of the product.

Not on any of the ones I can see here, I've just looked at several CD's
and not one suggests anything of the sort. Yours may differ of course.

> > Well so are you!
>
> I have nothing to prove.

Then why are you posting? It seems clear that you do have a point to
prove, one that I'm sick of you attempting to claim is not your problem.
You suggest that piracy is a problem (one you even ascribe the death of
Atari to) but then won't offer to do anything to fix it.

> I own everything I use.

So what? The fact that it's not you causing the problem is absolutely
meaningless. Ever seen people litter? That's illegal in most places.
Ever seen people gang up to clean an area, like a river bed? Your logic
is that since these people didn't toss the paper they shouldn't bother to
help clean it up. Nice sense of civic duty you have.

> Eventually... so in perhaps 70 years we can all freely, legally copy
> and use whatever 8-bit stuff we want.

Well it's obvious you don't know. As far as you know, they already expired.

> Interest level and contact with the market are not the same thing.

They are these days, because anyone with an internet connection can
access all the same things. If you think there's a problem with Yogi's,
why haven't any of the authors complained? Do you think that none of them
have internet access?

> It's probably a sfe bet that a lot of 8-bit programmers don't know
> that people are still using the equipment and software.

I came here to get information on a game I've never even seen, so that I
could write about space games in general. I have almost no interest in
the group other than that. If I have that little interest and I'm here,
one has to assume these authors have none whatsoever.

> care, maybe they don't. You are assuming that contact with the market
> is the same as interest level.

Welcome to the 90's.

> >> I guess I must have hung around a better class of people than you did
>
> > Name calling. So much for any claims to a moral high ground you may
have had.
>

> Not name calling just simple statement of fact.

Oh, I see, blanket statements about who a person you never met is a "statement of fact"? Bah.

> I didn't hang around with people who stole software.

Oh, good for you, I assume you're going to run for public office so the press can check into that perfect background of yours?

> If you want to equate theft to
> something morally neutral then you're debating from low moral ground.

Oh, good comeback, you don't even know what my moral ground is!

> >No, but you're quick to call people names and publically question their
> >morality. That's illegal too, believe it or not.
>
> Hmmm, calling a thief a thief is now illegal. What a concept.

Now you call me a thief, publically. I hate to break it to you, but "I don't agree with you" and "I think you're a snob" does not mean "I am a pirate" regardless of your preconceived opinions to the contrary. You should be very careful with your attributions.

I believe my point has been demonstrated, you are indeed using holier-than-thou arguments, while at the same time actively involving yourself in equally repugnant actions for all to see.

Maury

What an absolutely baseless argument! I state that you're blaming the
wrong people, and then you go right back and state the same argument
again!

Fine Ken, let's see the numbers. I want you to demonstrate, with
numbers, how piracy on the Atari 8-bit platform, led to a "premature
death" of the system. You will have to demonstrate how it is that the
death of the other 8-bit platforms at about the same time was _not_ due to
the same thing, because you have suggested this was mainly an Atari
problem.

> I'm only repeating what the third-party developers and the Atari
> magazines (and what Dave Bertschy has testified to doing) had stated
> for years.

I used to read most of the Atari mags all the time, I don't remember
this being an issue being widely discussed, if at all.

> The same situation exists now as it did then. Back then, the larger
> user base of the C64 could support a larger _incidence_ of piracy,

Yes, but you have failed completely to back your claim that the
percentage was any different either. You claim it, but I don't believe
it and I have yet to see any hint that you can demonstrate it.

> Especially when 4 out of the 5 were getting copies.

More attributions without any evidence. Retraction please.

> So, then to quote someone, "Before making blanket statements like
> this, I'd recommend you actually find out".

Well I hate to break it to you, but you're the one that made the blanket claim.

> To someone who is lazy and content with thievery, it would probably
> seem so.

And to one that's not content the lazyness is even more inexcusable.

> Why should I have to pay twice to support software pirates?

Because then the problem wouldn't be a problem.

> Now, you want to put the burden on me to do the pirates' job for them.

No, I just want you to admit your exactly as lazy as they are.

Ahhh, I see it now. "Ok, just because I'm holier than thou doesn't mean
they aren't too!". Good argument.

I believe there is a rider on total number of copies/plays as well.

How about the advantage of not having crates and crates of 5 1/4"
floppies laying around. I love my 130XE but I'm an apartment dweller
and I barely have room for all of my toys as it is. Face it, one of
those 3.2 gig harddrives that come standard with newer PCs takes up a
hell of a lot less room then 3 or 4 hundred floppies. I also like the
advantage of not going through this:"Where is my Rescue of Fractulus
disk? It's in here somewhere.........." Backups? That what the tape
or Zip drive is for? I'll stick with a real 130XE for trouble free
running of all programs even DEMOS but the disk emulators have the
real thing beat cold. The only use for my floppy drive is copying the
stuff to the PC.

Two sisters wrote Happy Birthday and still hold the copyrights on it. That
is why resturants do not sing Happy Birthday, but some other song.

Copyright law has changed, but I thought they last for 50 years after
the death of the author.

I am in touch with Ben sporadically. He has nearly cleaned out his Atari equipment but has a few items left. I'll save this message as a text file and send it to him, since he doesn't look at the ng any more. One possible glitch is that the magazine(s?) involved may still have rights to those articles, but Ben should be able to tell us if that's so, IF he's at all interested releasing the info in the articles.

Guys, I hate to say it, but we could Monday Morning Quarterback this stuff forever and it would serve no purpose. My own feeling is that the software houses felt not only that they had a smaller installed user base in the Atari community, but that they could push Atari around because of it. Remember when Atari proposed a 3.5" floppy drive? The software houses stated that if Atari went that way, they'd never again produce software for the Atari because it would cost them too much to make disks in both media sizes. But when Apple went to 3.5" drives, there was no problem! As for the role of piracy in killing Atari, I feel that the perception of piracy was a lot bigger than what actually existed.

But instead of revisiting old battles, we should concentrate on a way to preserve this community.

That, unfortunately, is my feeling, too. There was a serious lack of
focus in Atari's marketing efforts through several managements. The
hardware had so much potential, compared to other machines of its time,
too.

> Furthermore I have to completely disagree with you on the piracy issue

I don't think it makes a bit of difference at this time to point fingers
at other communities and say that they were more into piracy than we
were. That almost parallels the "machine wars" stuff, even if nobody
gets emotional about it any more.

Michael, you raised some issues that I discussed in a user group newsletter. As you know, many user groups have an anti-piracy policy, and some even forbid the discussion of piracy in any form during official club business. I invited comments, opposing opinions, slings and arrows, etc. None were forthcoming from the membership, which is international in scope. That may say more about user group members than the feelings of the community at large.

I feel that there's something unique about classic computers that's worth preserving, ours in particular (there's my prejudice showing again.) Preserving the software, commercial or not, is a worthwhile goal. I'm not sure that emulation is the only way to go, but as hardware ages, it will be an important part of the mix. Obviously, you can't have emulation without disk, cassette and/or rom images, which are files, which can be transferred, etc.

Some of the people in this newsgroup have suggested that the authors and/or original publishers of the software be contacted in an effort to get their permission to distribute this software as part of a heritage, perhaps with a small fee to those authors and/or publishers. I've expressed doubts that many of those authors and/or publshers will be found, or want to be found. I will state further that we won't find unanimity among them about releasing the rights no matter what our purpose is. But I do feel that the effort must be made. I'm going to bring that up at my next user group meetings (I belong to two groups,) but I highly suspect that there will be little heart to engage in such an effort when the groups merely want to continue to exist at this point.

I invite comments from the newsgroup, although I'm sure that I'll get them, invited or not.

Im now located in Orlando FL and was lucky to find the MFACC and even better was that Jeff Potter was the President. We meet once a month at the Library downtown Orlando, The Newsletter that MFACC publishes is going threw some changes at this time, there are plans to have a D.O.M. with each issue. Would like to exchange newsletters with you soon. Oh about your 130XE keyboard, your lucky. Keep in mind that painting traces on mylar is only quick fix and will buy you some time till a new mylar can be orderd. I have given up on mylar and nickel print :(

Its good to hear from you.

>monitor.

The 300 ohm problem needs more than a tone down, you almost
have to completly redesing the whole video signal. The 12ooxl had lots of
problem with video... but heres the good news.
Contact - Atari Classic Magazine - and order there VIDEO issue, it has
the SUPER VIDEO upgrade for the 600/800/1200XL plus the 130XE version.
The Upgrade is not hard to do and all the parts can be found at Radio
Shack. You have have to Look around for the 200mf 10volts cap if doing
the upgrade for the 800XL, but it can be subsituded with a 200mf 16volts
cap.
You will have a SUPER picture on the 12ooxl after the upgrade.
and its a MUST for games!

Len,
In the manual, they talk about this problem and caution the user. The y also mention that there are no checks. It would be nice to have the checks. Personally, I'd like to see a new/updated version wirh more commands and features. I have a list of things I'd like to see added. I put it together many years ago.
I happen to love BXE and use to program everything in it. I haven't done much lately, but may, if I find a project to work on. Maybe I'll finish my ColorDump (Color View 4096 color picture print program v2.0) The last version works ok, but needs more features (hense v20).

Ken,
BASIC XE has the BASIC XL tool kit extensions built in and uses the 130XE bank switched ram in various ways. You can use BXE on an XL or 800, but you don't get the bank switch RAM (unless it has a RAM upgrade that is 130XE compatible). The BXL tool kit is disk based and must be loaded. This is messy. I happen to own BXL, BXL TK and BXE. I find that many of the programs I worte didn't generally use upper RAM. I did this so I could distribute the programs and most people could use them. CDump 1.02 did us the upper RAM for the program and lower for the data. 1.03 was completely 64K compatible.

How about those effects? Not that it runs on my Mac, but now I am curious.

This last point deserves comment. Is giving an old Atari machine to a friend piracy? People would say no, because the person giving it away no longer has access to the machine. Ok, what about emulators?

Now the question becomes a little more interesting. Just about any way you look at it, an emulator is "hardware piracy". If I give you a copy of XL-it, you get to run it, AND I get to run it, with no money going to the (defunct) creator of the hardware.

So if we want to stamp out piracy, one must start with the emulators. Yet I don't see any posts suggesting anyone do this. Why not? What's so special about 16k of code being "stolen" when

Let's also not forget the whole concept of a copyright, the spirit of the copyright is to protect you from having other people _profit_ from your works. If anyone can demonstrate to me that anyone is _profiting_ from this, or that the original authors are _losing profit_ by this "piracy", I'd love to see it.

The only availability (with certain terribly minor exceptions) of anything for the Atari 8-bit world is 2nd hand or archived. This is a good thing, everyone wins, and as far as I can tell, no one loses.

Don't be too quick to condemn this as "piracy" or every museum in the world would have to close it's doors too. When it comes right down to it, this is a collective hands on museum effort that should be applauded, not condemned as some sort of shady activity.

Maury

p.s. Has anyone contacted some of the authors? I'll bet many would be flattered to see their 15 year old code still being used.

Not at all, split your forces, go around the Pripet marshes, and pincer the main block of sov forces in the area behind the marshes (south of Moscow). If you need more territory, spread them further apart , north of the Crimean for instance, and move one group then the other. The sov forces will jumble into a block, chasing the force that is more mobile at that time, so you move one, they go up, you move the other, they go back down again.

Resist the urge to go gunning for cities, you'll spread yourself too thin and get picked apart. Also, playing defensive is deadly, I used to try holing up in Leningrad, or in the Crimean, but you never get back out through the huge block of forces facing you.

If it's as easy to do as you claim, and you're so outraged as your
messages suggest, you do it. Go ahead, you can get JTS's phone number off
of the atari web page. Be a hero instead of a whiner.

Oh I know what you're going to say "I don't pirate, why should I do the
work". Well all I can say is that I doubt any of the men in the
right-to-life movement have had an abortion, you do what you believe and
inaction on your part demonstrates that your messages don't really seem to
be backed by anything more than spare time and a UseNet connection.

> If I can take $40 from your wallet and you never find out about it I
> can pretend I didn't do anything wrong. Right?

It's not at all like that, not even close. If I cover someone else's
tune in a show, I don't have to pay them a cent. If I cover it on a CD,
then I have to pay. It's painfully clear that no one here is a copyright
lawyer, and that includes you.

> You are advocating distributing copyrighted materials and denying the
> owners their rightful compensations.

Copyright does _not_ guarantee "rightful compensations", it _protects_
you from other people _profiting_ from the distribution or copying of your
materials. If you can demonstrate that they archives are doing this, be
my guest.

> justify this by assuming that nobody cares, since you are too lazy to

You ascribe far too much damage to Atari's market to the wrong people,
Atari's failure to "beat" the C64 and Apple II in the marketplace rests
entirely on Atari's head, and nowhere else. They had the 800 out when
Commodore was introducing the Vic 20, if that doesn't give you a lead I
don't know what will. Atari blew it, period.

Furthermore I have to completely disagree with you on the piracy issue
here, the C64's piracy "problem" made the Atari's look like a joke. There
were _hundreds_ of pirating software programs, all sorts of hardware,
things that never existed on the Atari because the market was too small.
A bud of mine in U had a C64 collection spanning something like 200 disks,
all with multiple titles on it.

I knew maybe 5 other people with Atari machines, and none of us had
enough money to buy more than one or two programs, that's not much of a
market.

> If you download something from the net that was commercial/non-pd

Sorry, but copyrights expire and titles become public domain by default,
although I don't know the specifics of this action. For instance, the
song "happy birthday" reverted to public domain some time ago. Before
making blanket statements like this, I'd recommend you actually find out
if this is true or not, because I don't believe it is.

You go one to suggest that we should all endeavor to contact the authors
and ask them about their interests in the software in question. A fine
idea, but one that is obviously impractical, obvious to the point that
even asking people to do so appears to be flippant.

Seeing as you appear to have a problem with this issue, why don't _you_
write the authors in the question. If you actually start such an effort,

people will join it. Write back when you've completed the first one. If the author of Halcyon Days can do it, you can too.

Really? Explain what sort of attitude a person holds when they believe
the laws don't apply to themselves? Obviously pirates consider
themselves superior or immune to the copyright laws that all us normal
people are subject to. So, why does pirate morality make them
superior to the rest of us?

The subject was a $50 CD-ROM, not the archive. And copyright lisences
typically do describe that compensation is due for use of the product.

>> justify this by assuming that nobody cares, since you are too lazy to
>> find out if the copyright owners have actually waived their rights.

Eventually... so in perhaps 70 years we can all freely, legally copy
and use whatever 8-bit stuff we want.

>> Here you are assuming things again. Just because you think the
>> producers of software aren't interested in it, doesn't make it so.

> I believe the fact that the authors in question have done absolutely
>_nothing_ whatsoever about this issue is a good demonstration of their
>interest level.

Interest level and contact with the market are not the same thing.
It's probably a sfe bet that a lot of 8-bit programmers don't know
that people are still using the equipment and software. Maybe they do
care, maybe they don't. You are assuming that contact with the market
is the same as interest level.

[snip]

>> I guess I must have hung around a better class of people than you did

> Name calling. So much for any claims to a moral high ground you may have had.

Not name calling just simple statement of fact. I didn't hang around
with people who stole software. If you want to equate theft to
something morally neutral then you're debating from low moral ground.

[snip]

>entirely on Atari's head, and nowhere else.

So, Atari built the coffin and the pirates only nailed the lid shut,
dug the hole, dropped it in, and filled it up.

I'm only repeating what the third-party developers and the Atari
magazines (and what Dave Bertschy has testified to doing) had stated
for years. Third party support existed even thought the Atari had a
smaller user base. Third party support disappeared sooner, because
piracy was more damaging to the smaller market.

>Furthermore I have to completely disagree with you on the piracy issue
>here, the C64's piracy "problem" made the Atari's look like a joke.
> There
>were _hundreds_ of pirating software programs, all sorts of hardware,
>things that never existed on the Atari because the market was too small.

The same situation exists now as it did then. Back then, the larger
user base of the C64 could support a larger _incidence_ of piracy,
since the larger user base meant more people actually did legitimately
purchase software. The same goes for PCs today. There are easily
more people pirating PC software now than have ever even used an Atari
8-bit. But the PC survives, because the user base is larger and some
of them do buy stuff, more than enough of them to keep developers in
business. Given the much smaller user base of the Atari, a single
incident of piracy had a much more damaging effect to developers than
a single act of piracy on other platforms. Piracy on the Atari 8-bits
was a greater problem with its smaller user base compared against any
other platform. (Perhaps, except for the Amiga.)

>A bud of mine in U had a C64 collection spanning something like 200 disks,
>all with multiple titles on it.

I did not see the same thing. Out of the three people I knew with a C64, only one copied stuff and even he bought things. I personally never met anyone who had a library of nothing but stolen software for the C64. I knew several people like this with Ataris.

> I knew maybe 5 other people with Atari machines, and none of us had >enough money to buy more than one or two programs, that's not much of a >market.

Especially when 4 out of the 5 were getting copies. If 4 out of 5 C64 users copied, there could still be enough total people buying to keep a developer in business. On act of piracy on the Atari had the same impact as dozens of incidents on platforms with larger installed user bases.

(Imagined poverty is another one of those lame pirate rationalizations. Do you remember what the computers and floppy drives cost? So, you spent all your wittle pennies on the computer and couldn't afford to buy any software? Dry that one out and fertilize the lawn.)

>> If you download something from the net that was commercial/non-pd >> software you should find out who owns the copyright and make every >> attempt to contact them about purchasing it. > Sorry, but copyrights expire and titles become public domain by default, >although I don't know the specifics of this action.

So, then to quote someone, "Before making blanket statements like this, I'd recommend you actually find out".

> You go one to suggest that we should all endeavor to contact the authors >and ask them about their interests in the software in question. A fine >idea, but one that is obviously impractical,

To someone who is lazy and content with thievery, it would probably seem so.

> obvious to the point that >even asking people to do so appears to be flippant.

There are these nifty books at most bookstores about how to find anyone, anywhere. (You might even find one up at the local library if the idea of paying for something is so anathema to you.) Companies and individuals with copyrights leave significant paper trails.

> Seeing as you appear to have a problem with this issue, why don't _you_ >write the authors in the question. If you actually start such an effort, >people will join it. Write back when you've completed the first one. If >the author of Halcyon Days can do it, you can too.

Why should I have to pay twice to support software pirates? I kept
software publishes in business as long as possible by buying software.
Now, you want to put the burden on me to do the pirates' job for them.

I believe the decision was made from the standpoint of gameplay. The
Germans in the scenario are more challenging to play, plus it would have
been much harder to write a decent AI if the computer played the Germans.

The owner of copyright under Section 106 (US law, in most other countries the law is very similar) has the exclusive rights to do and authorize any of the following:

1) to reproduce the copyrighted work in copies;
2) to prepare derivative works based upon the copyrighted work;
3) to distribute copies of the copyrighted work to the public by sale or other transfer of ownership, or by rental, lease, or lending;
(more rights are specific to formats not applicable to software.)

Commercial software, Shareware and Freeware are all covered by these exclusive rights of their copyright owners.

(Truly Public Domain software is not protected by copyright.)

The law makes no distinction based on whether profit is involved, and I would disagree that such a distinction is intended "in spirit."

> The only availability (with certain terribly minor exceptions) of >anything for the Atari 8-bit world is 2nd hand or archived. This is a >good thing, everyone wins, and as far as I can tell, no one loses.

B&C, Best, Video 61, Micro Discount, Evangelo's, and LOTS of lesser known vendors still sell oodles of never-opened commercial 8-bit Atari software. Nobody can say with any certainty that any given title is no longer available commercially, I would suggest.

I just bought a new copy of Super Breakout from a certain commercial vendor (mentioned above) the other day. May I assume I could have just downloaded it off the 'Net?

The duration of a copyright is dependent on the date of creation.

For those works created on January 1, 1978, or later (this includes all
copyrighted 8-bit Atari software!), the copyright lasts:

1) for a sole author--life of the author plus 50 years;
2) for joint authors--life of the longest living author plus 50 years;
3) for works for hire, anonymous, or pseudonymous works--75 years from
publication or 100 years from creation, whichever comes first.

Freeware/Shareware generally fall under (1), while commercial software would
be Works Made for Hire, (3) above.

(Again, this is applicable internationally, not just in US law.)

Huh? What exactly do you use your Gravis Gamepad on and how is it
hooked up? What do you think of the Microsoft Gamepad?

Cheers,

Jon

>Does anybody know how to connect them ??

I would say it would be a heck of a lot easier to get yourself digital
mode capable Microsoft Gamepad or Sidewinder Pro optical/digital
controller. Those are what I use on my PC, and the response is mucho
quicker than when I was using an analog only Gravis Analog Pro
joystick. I do miss the shorter handle of the Atari joyticj though.
Some of these big grip handles are not very condusive to manipulating
with the fingers. Using the fingers to move the stick I feel gives
the best control rather than a whole hand but....

Best of luck to you.

Microsoft has found a way. It's Gamepad and Sidewinder Pro have a
mechanism which is optical translated to digital (much like a mouse).
Of course, the Sidewinder also has a legacy analog mode for
compatibility as well. But they are definitely digital, because I
have seen the controller response in Quake go from what I consider
unacceptable to very acceptable after getting the Gamepad & Sidewinder
Pro. I do not have any technical specifications hardware or software
wise, but they say they have pure digital modes and my personal
observations support that.

It's at Rob Funk's site. He has a full description and schematic. His site is:
><A> HREF"http://er4www.eng.ohio-state.edu/~funkr/Atari/"> </A>
>If the above didn't show Here it is again:http://er4www.eng.ohio-state.edu/~funkr/Atari/.

Doesn't that simply make the Atari digital joystick appear to the PC
as an analog joystick? If so, the problem with analog joysticks on
the PC is poor performance. The PC is now finally going to a digital
standard and the games have quicker joystick response.

>down again.

That proceedure will leave a number of Soviet units in the Pripjet.
I have read the German review of "Die Pripjet Probleme". These
marshes are a serious problem and serve as a base for attacks
against the rear.

> Resist the urge to go gunning for cities, you'll spread yourself too
>thin and get picked apart. Also, playing defensive is deadly, I used to

I certainly found that attacking Leningrad was a mistake. The Finns
never help. They refuse to advance. Also the south and Kiev is a
trap. (Hitler found that out.)

I have just bought an Eastern Front cartridge, so I will get out
my old 800 and give it a try.

Actually just the music to happy birthday had its copyright expired. The lyrics are STILL copyrighted. (I'll be damned if I'll pay a "public performance fee" to the holder of the (C) at someone's birthday party where we sing it, but TECHNICALLY, we would have to)

I called Activision in 1990 to order some 8bit software that was no longer avalible threw commercial channels and was told, Sorry but we dont publish for any 8bit platform and there was no more 8bit software in stock. I was a bit upset. Im glad that serval of those program that I've been looking for years have been floating around on the Internet. I have also lost software due to floppie falure "Bad Sectors" on old disk, that is no longer avalible anywhere!
It wasnt the pirates that killed the 8bit, It was the introduction of the 16bit machines. Why sell a computer for $85.00 when you can sell one for $1,000.00 Remember the agreement between Atari and Commodore not to produce 8bit machines, I do.
Atari's foundation was 8bit' and they blew it. But then again technology must go on, we should all be thankfull that we had almost a 10 year production run.

Now the problem is that a new user to an 8bit will have problems hunting down software to the point where its not worth the effort.

Try Calling Activision and see.

>they aren't too!". Good argument.

I was considering stepping into this, but feel the flames are getting pretty
high already.

In the interest of cooling things down, I might remind people that
copyright violation is not a criminal offense, only a civil one.
And that only the copyright holders can bring action against violators,
not commercial operations such as mail order vendors (unless they
also happen to own the copyrights, as does Bub Puff and FTE, I believe).

The tone of a lot of the debate seems to be ascribing criminal
behavior to pirating software, or justified rebellion against
some form of inequity to the same action. Let's try to keep it more
in some sort of perspective.

After all .. even Bill Gates, with all his ranting back in the
days of the Altair about people stealing money from him by
pirating Microsoft Basic, would probably not be where he is
today if people had not pirated his software ... which both
increased it's popularity, and caused Microsoft to react by
licensing to the hardware manufacturors rather than the end
users.

Whilst reading the rubbish I usually find here, John Harris wrote something=
interesting about "Eastern Front"

Hello John,

JH> I believe the decision was made from the standpoint of gameplay. The
JH> Germans in the scenario are more challenging to play, plus it would

Makes sense, but it does mean that people are going to be disappointed,
because the game then becomes very hard to "win". Of course, the plus side
of this is that the challenge will be there much longer, despite short-term
disappointment.

JH> have been much harder to write a decent AI if the computer played the
JH> Germans.

Sorry, but I can't see your reasoning here. Care to explain? I'm not
saying you're wrong, just that I can't see why you're right.

Hi,
we're planning to release an update of the Pooldisk CDROM
in the near future. On this cd, there are a lot of photo's
dealing with Atari 8bit equipment. However, not all the peripherals
Atari made are on there. There are still some missing.
If you've got a device which is not on the cd, please make a
picture (or pictures) of it, and digitize it.
Send the digitized picture (preferably a .PCX file) to the
email address below:

stack@xs4all.nl

Thank you,
Bo.

>
>

I think the 1050's seemed to have a lot of bad track 0 sensors
(Which I just proved recently with 1050diag [thanks to Euskara ;]) and a
lot of it depended on what mech you had. Other than that, most of what I
had was pretty reliable (My 800xl took a dump but it was abused during
transit,moving,storage,etc so I can understand that [probably shorted the
PBI when the door fell off]) My 810's are 15+ years old and still cranking
as well my 2 1200's and my upgraded (with 16K upgrade sticker) 400 circa
1980.

As far as DAUG, we could rename it FAUG but that might conflict
with the ST,TT crowd and give the wrong impression. I was thinking more of
along the lines of a regional(statewide?) emulator and/or classic computer
group. We've been banging around this idea and there are a lot of closet
fanatics out there its just hard finding them (unfortunately not all of
them read usenet or more specifically c.s.a.8b)

Seems to me it's a lot easier to write a defensive AI than a offensive
one that needs to know about things like encirclement and maintaining
supply lines. This problem is common to wargames even today, when playing
a defensive position with a numerically stronger hand, I can easily defeat
every computer AI I've gone up against. On the other hand the offensive
position always offers challenges.

> Now the problem is that a new user to an 8bit will have problems hunting
> down software to the point where its not worth the effort.

That's why new users have to understand that they're not alone. There's enough p/d and shareware out there to cover most, if not all, of their needs. There are also user groups, this newsgroup, and other sources. If they own a PC as well as an 8-bit, they can use SIO2PC, or A. P. E., or even a simple null-modem connection to get the two talking. And if they also own a PC, there's the Web, UMICH, and the other archives if they want to try emulation.

About 16-bit machines replacing 8-bits, I sort of half agree. But most of the ST owners I met at that time were looking for more, faster, better, and got nothing but empty promises from Atari, or at best, long delays.

Interesting. My wife and I took a week's vacation in Vermont. We went to a little restaurant in Burlington that happened to be decorated with sheet music -- mostly old standards. The restaurant also had a sticker on the door stating that they were dues-paying members of ASCAP.

I doubt that it will ever be accomplished, but a rather idealistic guy on FidoNet once proposed a national umbrella user group with a national BBS for all Atari 8-bitters. His point was that such a group could raise enough money to buy the rights to the moon, let alone Atari-related intellectual property.

Hello, I'm Benjamin Smith, Proprietor of Bravo Sierra Computers. I took the Name Bravo Sierra not because it mirrored a quality of Bull Crap in me. But because my initials are Benjamin Smith. I was named after my Grandfather, Benjamin, whom I never met as my Dad was Orphaned as a Boy because both His Parents died. My father teaches me a lot and I thank God for each Day I have. My dad instilled Character in me. Don't make promises I can't keep. Don't bet money I can't afford to lose. Not to set goals too far out of my reach thereby keeping my Stress level down and keeping Depression manageable. I work closely with "The Shadow" of Shadow Software and I'm Listed under Bravo Sierra Computers under Michael Current's vendors & developers list. If I don't have what you wan't I'll try to send you to someone who does. Any ways I'm open for business. Read the last 4 lines below to find me.

I, too, would like to see your emacs editor. Emacs is my editor of choice on the unix systems at work, and it's be kinda cool to have the same editor on the Atari. Besides, not much can beat emacs in terms of flexibility, even if yours is only a subset....

MM> offensive one that needs to know about things like encirclement and

Right, I can see that. Thanks for the explanation.

In a similar vein, it's the main reason there aren't any good GO programs=
on
computers. Too many possible moves at any given time, except very close to
end-game. Unlike chess, where moves are restricted, etc.

Ok folks I am looking for an Atari SH204 hard drive for my Atari 1040STFM. I would also consider a Supra HD but I need everything to be like new working order and complete. If it requires anw software I need it and the instructions. I have never ran an St with hard disk and need all the help I can get. E-mail me with your prices. Money is tight as always so the cheaper the better.

>Jim.

Ok I reread the message, I have never hred of a 256k XE upgrade, Only
320-576 The 256k upgrades are for the XL
systems. How is the author of this 256k upgrade?

I lost the complete data file due to hard drive crash on the Auction I had on the following cartridges.

Frogger, Qbert, Star Raiders, Donkey Kong, Millipede, Ms. Pac-Man, Miner 2049er
Atari Writer, Asteroids, Missle Command, Adventure Creator, Super Breakout, Tennis
Moon Patrol, Delta Drawing, Final Legacy..These are carts only no documentation or
boxes..

I also have an Indus Disk drive in good to excellant condition...Comes with power supply
and sio cable. $30.00 shipped

The cartridges are up for bid one or all..add $3.00 to carts for shipping one or all..

bob

Source record: 71242

Hi!! being a old atari user, and a new user to xl-it!, are there any lists of the settings required to run specific rom images or files?? I've been doing the try this setting, try that setting approach, and it's getting REALLy old!! for some reason I can't get rescue at fracatalus to recognise key commands, and I can't get some things like ballblazer and galaxy defender to run (I remember the latter needed basic installed, buyt I'll be damned if I can remember how to get it running!!

also alot of game exe 's were distributed on floppies with menus in the boot load.. any of those floating around anywhere?? (that'd be alot easier!!)

any help would be appreciated!!

a really powerfull 80-char Editor is in the UMich Archiv availble. It's name is KEdit and is a very powerfull text based editor with much functions. It uses standard E: device access so it should work with almost all E:-Handlers. The best option I remember was the XE support for text with a size up to 320k !!!

Question! if copyrights last the lifetime of the author + 50 years, why
is it after say 12-18 years, remakes of songs can come out. We have all
heard of dozens of remakes of old 70s songs, old 80s songs. Isn't that a
violation of copyright under your post? (I thought copyrights last only
12-18 years)

I saw it at EB for $4.99, it's a deal at that price. Of all the Star Raiders clone/update attempts, this is probably the best one that comes closest to the spirit of the original. Cheezy sound effects though, but decent gameplay.

Record companies almost always owns the right to a song.
Record companies want to make money, they love to make money
on the same song again and again (prefferably by releasing new
formats CD's etc) .. So If you pay royalties and
a fee to the owner they probably let you release a remake.

Acri,
There are 3 emulators that I know of. PC Xformer, XL-It and rainbow. XL-It and Rainboe are available at the Umich Archive ftp://atari.archive.umich.edu/atari/8bit/emulators .
PC Xformer is available from the author's site Emulators Inc. http://www.emulators.com .

Get all of them as one work better than the next for some things, depending on the application.

Hi,

I just want to inform you that I have updated my xl/xe demos site.
-released VENT -modified-
-released ASSKICKER -modified-
-released CubEMenU -0.1beta-

facts about cubemenu:
*load binary files while lots of memory is free (loader uses $700-$7FF
for sector buffer and $800-$8E2 for code)
*trace binary files for used memory
*supports APE
*requires DESCRIPT.ION files
*single/double density disks up to 1MB
*fast (xf) sector read
*dos 2.5/bibodos/mydos comp. disks
*mainly it was written for these huge megaimages (demos/games)

go and get cubemenu:
http://www.tu-chemnitz.de/~sgl/atari/demosind.htm#cubemenu

go and visit the xl/xe demos site:
http://www.tu-chemnitz.de/~sgl/atari/demosind.htm

Regards, CubE.

I remember when Atari 800's were affectionately referred to as "tanks". You could beat the crap out of them and they kept running. I found one that was throw out of a car window at a donation station with a shattered case. I was allowed to take the pieces left and when I connected what was left to an old power supply and TV, it worked!

Guys,
Ok, I looked at the site above, but what is the name of the file? "Asskicker-demo" does not exist!

Star Raiders for the 90's

Star Fox 64 for the Nintendo 64 game console absolutely ROCKS !!!
It's about as perfect a "3d-space, save-your-system, type thing"
as you could possibly imagine. It's got *stunning* 3D graphics,
intense seemless playability, *ACTUAL BONE-JARRING* special effects
with the rew "Rumble Pack" that comes with the game (plugs into
your hand controler and *literally* shakes and vibrates it at various
frequencies depending on how hard you got hit or ran into something),
realistic 3D aerial dog fighting (with loops, 1/2-inverted turns,
barrel rolls, boosters, brakes, realistic HUD [heads-up display]
gunsights, laser cannons, radar "tone" lock on enemies and when
enemies lock onto you), continous stereo soundtrack plus effects,
and even fun cinema-style character development (a la Star Wars).

The game designers obviously played Star Raiders when they were
young and they pay a great tribute with this wonderful remake
using the latest technology. Star Fox 64 also has a fabulous
cinematic feel to it, with the authors giving a tip of the hat
to the many sci-fi and action movies that inspired this game
as well, including "Star Wars", "Star Trek", "Independence Day",
"Raiders of the Lost Ark", "Top Gun", and others. Some of the
most impressive cinematic elements are the dramatic, sweeping,
camera movements, the choreographed intellegent movement of the
many enemy and allied spacecraft, and the realistic filmlike
camera and lighting effects like lens-flare and multiple lights.
Hell, if you get a big screen TV and surround sound, you'll
swear that you're actually *INSIDE* a movie, or on a HoloDeck!
You can experience this for the bargain price of about $210,
which includes the price of the game console and the game.

Disclaimer: No connection to Nintendo.
Just giving credit where credit is due,

Happy star-hopping,
Charlie

Ok, it is a 320 upgrade.... Old age you know, memory fails :)
It has worked fine for several years, the video flicker just started to
occur. It is useable, the characters just seem to have some kind of
video noise. The rest of the screen is ok. It is not the monitor,
hooking up another Atari doesn't have the same symptom. Jim.

I was at the Air Force museum last week, and saw them putting together a
Zero. Mitsubishi still owns that design, but I don't see their lawyers
lining up to sue the WPAFB.

There's a difference between "archival fun" and "copying for profit" in
my books, and to me it's clear which side of the fence this thread is
concerned about.

844. ATARI Equipment MUST SELL!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1997-07-31 00:00:00 UTC
From: tort@springnet1.com
Message-ID: <33e2e6f8.5298285@news.springnet1.com>
Source record: 71264

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV
connector, original cost $599.00, Joysticks $19.95 each, asking $50.00
or best offer. These SELL AT Video 61 for $49.95 used.

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers,
manual, power supply, connecting cables, oil, original cost $399.95.
Also have a non-working 1027, can be fixed at any Atari service center,
both printers cost new $399.95 each, asking $100.00 for both of them.
Again, these sell, each $49.95 at Video 61.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very
good condition, like new, supports single and dual density modes,
includes power supply, original cost $179.95, asking $75.00. These
sell at Video 61 for $74.95, same price.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers.
Upgrades and replaces the 6502C in the computer with the 16-bit 65C816
CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up
programs as much as 350% faster. The 65C816 processes 4 instructions
per clock cycle (Only the new P6, 80686 Intel chip does that, besides
this), as compared to the 6502 which processes one instruction per
clock cycle. Original cost $249.95. Includes T816 assembler $75.00,
Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks,
valued at $25.00 each. Asking $250.00 for the entire package. These
are not currently available anywhere else that I know of.

ATARI 800XL upgraded to 256K memory, will run most 130XE specific
programs, already wired for Turbo-816 installation, just need to
re-solder 3 jumpers, and plug in the Turbo-816 kit above. Original
cost $189.95 for the 800XL, $79.95 for the Upgrade kit, $65.00 for the
256K DRAMs, asking $125.00. Video 61 sells the USED 64K model for
$59.95.

Supra External 2400 Baud Modem, includes powewr supply, no manual,
Hayes Compatible, requires 850/P:R:/ATR8000, asking $30.00

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue

Decatur, Illinois 62522-1537

Will consider trading for a trak AT-D4 double sided disk drive NEED
ONE
BADLY someone has to have one, or a trak double-sided slave drive.
MAKE OFFERS!!

As Per US Code, Title 47, Chapter 5, Subchapter II 227

> kenneth at daffy dot aatech dot com
> ken at ntalr dot aatech dot com
I was a sucker and Bougth Diamond OS for the Atari, also the
programming kit, etc., it was pretty good

Then I fell for the upgrade to Diamond OS 2... The Author Reeve Soft,
ripped me off, never sent the Programmers kit flor 2.0, it's full of
bugs, won't work properly, locks up, and he left Illinois, and the
last I saw of Reeve Soft, he was makiing and markeitng a utility to
read MAC disks on the IBM, and he had moved to Kentucky?

I'm not the only one he ripped off, but if anyone wants Diamond OS,
get the first version, because 2 is the worst piece of garbage ever
made.. It was available on disk, and I do have the disk and both
cartridge versions, although the 2.0 chips ase worthless if you ask
me. The software I bought with it, Diamond Paint, etc., won't even
work with it...

I'm assuming there as no devloper's kit for it, since it obviously was released full of bugs, and he has no intentions of fixing it, but I'd at least like the money I paid for the developer's kit back!!

It was made for many computers of that era, even the the old PC.
IMHO, the Atari version was the best of the lot. Anyway, a spiced up
version of Archon has been been released for the PC which uses sound
cards, VGA graphics etc. They changed the name to Archon Ultra & the
game play a little bit, and they explain how in the manual but I
forgot. It's not too bad. It's published by SSI. You can get it on
it's own, or as a better value in their Crittic's Choice game bundle.
It's for DOS.

Jon

I agree. The version of Archon for the Atari 8-bits was the best, IMHO.
I've seen Archon Ultra on a friends PC, its OK...it is VGA-256 colors,
just be aware that when it goes to the combat screens it drops down to
only 16 colors, AFAIK... :)

Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SLM 124
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of
Shadow Software. Older Technology made with a lesser chance of Planned
Obsolescence. Built like Tanks. The Shadow tells me each one worked
before they were taken off their Computers. Each one, $25, as is. Model
numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for
Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST
HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may
find something you've been looking for. Something you might want. Even
Something you may of Forgot! At BSC's Web Site you can View, Capture &
even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request
Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why
not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or
Feel free to Request catalogs through E-Mail. Really, it's no inconven-
ience. All I ask is that you specify Atari 8 Bit, Atari ST or both.
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I
will get back to you after the weekend. Please let me know if I can't
attach files to your E-Mail. Please Direct any and all Replies Through
E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in
Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC
Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow
Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer
Platform. Also from The Shadow of Shadow Software (my Boss) a File

called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Welcome to the Summertime Atari Auction

Rules:

1. Please don't participate if you wont pay for bids you win
2. Winners are responsible for shipping charges
3. Bids will start with minimum amounts and go up in $1.00 increments min.
4. I reserve the right to pull an item at anytime for a buyout or trade
5. Auction goes into Going Once/Twice/Sold on August 15th.
6. Respond with EMAILs only, I will not check the newsgroups for
responses.
7. Winners should send Money Orders or Checks. NO CASH please.
8. Respond to: cvendel@aol.com

Atari 2600 Items:

Atari Dodge' Em SEALED in a rare all WHITE box with black lettering
Minimum Bid: $5.00

3 Atari Walt Disney: The Sorcerers Apprentice Cartridges Only
Excellent condition, Blue/Yellow labels with Full Color Image of Mickey in
Wizards robe.
Minimum Bid each: $5.00

2 Atari Seasame Street Packages:

Cookie Monster Munch SEALED in original box/plastic
Big Birds Egg Catch SEALED in original box/plastic
Atari Kids Controller SEALER in original box

Each package is sold as a set and will not be broken up.

Package #1
Minimum Bid: $20

Package #2
Minimum Bid: $20

!!!!!!!!!!Atari Lab Loaner Cartridges!!!!!!!!!!!!

Yes, these are REAL lab loaners with actual Atari black/white loaner
labels on
them, these are no the fakes or copies you may have seen in the past.

Atari Joust 222
Minimum Bid: $20

Atari Cookie Monster Munch
Minimum Bid: $20

Atari Big Birds Egg Catch
Minimum Bid: $20

Atari Donalds Speed Boat Race
Minimum Bid: $20

Atari Memorabilia:

Millipede Hanging In-Store Mobile advertisement (sealed in original bag)
Minimum Bid: $10

Centipede T-Shirt (large) with Atari Store tag still on it.
Minimum Bid: $10

Atari Prism: This is a TRUE COLLECTORS PIECE
Glass prism with Atari floating in the center with an Atari custom IC chip
also
floating in the center. At the base of the prism looking down from the
top you can read "Atari... We brought the computer age home"
Minimum Bid: $25

852. WTB: Complete Atari 1030 modem

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-01 00:00:00 UTC
From: Jeffry Johnston <homepage@http>
Message-ID: <5rs7ts$f2r@nntp02.primenet.com>
Source record: 71177

Hello!

A while back I bought an incomplete atari 1030 modem and I am now
regretting it because I cant get it to work. By complete I mean
everything: power adapter, modem, I/o data cord (sio cable), and USERS
GUIDE <--- most important. I dont really need the box or telephone cord
but would appreciate it if you threw them in with it. Please name your
price. If you have the users guide and would be willing to help me get it
working I'd really appreciate it too, I have a feeling the modem works
fine, but I have no way of knowing without the manual. If theres a disk
that comes with it ill need that too btw.

Thanks,
Jeffry Johnston

: Star Raiders for the 90's
: -------------------------
: Star Fox 64 for the Nintendo 64 game console absolutely ROCKS !!!

(lots of stuff omitted)

I don't think that you could possibly get further from Star Raiders than this, really. For a real tribute to Star Raiders, keep an eye out for the release of Battlesphere for the Jaguar. One of the play modes, "Alone against the Empire" is very much based upon Star Raiders, only Battlesphere uses a 3-D environment with Gourand shaded/texture mapped polygonal models rather than bit-maps. The programmers are actually playing the original Start Raiders as a guide to playability in their development.

Other Battlesphere play modes will offer up to 8-console networked games in a variety of formulas (team based war, free-for-all, co-operative, etc...)

Aloha,
John Perez - jperez@hawaii.edu

From: "R. Eric Lyons" <relyons@mindspring.com>
Message-ID: <33E1E6FE.AEDE507D@mindspring.com>
Source record: 71184

I've been looking for a power supply for an Atari 800XL that I picked up at a flea market last weekend.

My parents have an Atari ST at their place. Can anyone confirm if these two power supplies are compatible?

Also, does anyone know where I can pick up an Atari 800XL power supply in the metro area of Atlanta, GA?

Thanks for the help folks....

Not sure about the compatibility, but they do not have the same plugs.
You would have to do some extensive modifiying -IF- they were the same.
I think you would be better off trying to find an 800XL's power supply.

>Also, does anyone know where I can pick up an Atari 800XL power supply
>in the metro area of Atlanta, GA?

Sorry, can't be of any help there-but most good Atari dealers still carry
this stuff...Good luck! ;)

Uncle Fester (thester@nyx10.nyx.net) wrote:

: But seriously -- I didn't read how this thread seemed
: to start, but if it is meant to mean that Stephen Tucker's
: APE software is being used for piracy, I disagree.

I disagree also. For years I have been looking for a way to save my rapidly failing diskettes from decay, and although periodic duplication can prolong this, 5 1/4 diskettes (new ones that is) are getting harder and harder to find, and in any case don't hold up very well in the climate here. A Black Box and SCSI drive has been enticing to me, but that would only save my unprotected files, and not the vast majority of my investment in 8-Bit games that I want to be able to keep. I spent a whole bunch of money on games (when I could find them in stores in the 80's) and I have no intention of letting them all fade into oblivion. APE is the most exciting product that I have run across for the 8-Bit, not as a piracy tool, but as an archival tool and as a time-saver.

: Happy Computing's "Happy 810/1050" hardware/software was
: not intended for use as a pirating "tool" although it >could<
: be used for that. Most of us who have the Happy drives use

Right! I bought the thing to keep my own software collection functional. There is nothing more annoying than having paid $40 for a game that stopped working 2 weeks after purchasing it. I still have the diskettes for games like Caverns of Callisto, Spelunker, Wizard of Wor, and others that I haven't been able to play since two weeks after I bought them because the software companies used the least expensive diskettes that they could when they distributed games. Is it against a law for me to copy these so that I can play them again? Probably. Is that right? No!

: It's a wrong-headed conclusion that is in the same category
: as saying that the only purpose of the internet is to
: distribute pornography.

I concur. Any technology is what you make it.

: copy these so that I can play them again? Probably. Is that right? No!

As a follow-up to this, I decided to go through my copy protected diskettes and test them to determine which were still functioning. Virtually none of the copy protected games worked, almost all of my non-protected diskettes are completely readable.

A lot of people are blowing their horns about piracy, but nobody seems to be concerned about how this whole issue affected the consumer. Copy protection, in my experience, had the net effect of rendering most of my software unusable. This goes for 8-Bit software as well as Atari ST software. The more heavily protected a diskette, the more likely it would fail. While software companies thought they were protecting themselves from loss of profits, all they were doing was screwing the customer that did plunk down cash to buy their games. Let's face it, copy protection schemes never stopped anyone who really wanted to copy anything.

If APE in conjunction with internet archives means that I can get back some of the many games that I have lost due to copy protection flakiness, then what is really wrong with that?

You fellows that are attacking APE and these archives, please just try to see the beneficial side of these. The fact is that I stopped using my 8-bit because of diskette flakiness, and I stopped buying 8-bit software because it was always so fragile. If these will provide a means through which I (and everyone else) can enjoy using the 8-bit again, and the software that I (we) paid for, then I think those are good enough reasons for these alternatives to remain available.

Aloha,
John Perez - jperez@hawaii.edu

>the best control rather than a whole hand but....

I wholeheartedly agree with this. I can get much faster and more precise control with a small fingertip control stick. The Kraft was always my favorite on the 8-bit. Nice predictable corners too. Most of the computer industry does not seem to be on this wavelength though. Everyone makes whole-hand joysticks.

The thing is, whole-hand joysticks do have one huge advantage. When using a small hand-held fingertip stick, there aren't many options left for getting convenient access to extra inputs, like more buttons, hat switches, or keyboard control. Whole-hand sticks typically have 4 buttons plus a hat switch which acts like four more buttons, and all of this is easily accessible with one hand. You still have one hand left for keyboard or something else. For complex games, it's an advantage that far outweighs the lessened controllability of the stick itself. I have thus tried to get used to the larger sticks, and have gotten a lot better with them.

Here's a tip for those of you that play with analog sticks on PC's or whatever, and find the travel range of the stick too long and thus slow in response. When given the calibration options, it generally tells you to move the stick to all extremes of motion. Well, here's where you cheat. Only move the stick as far as _you_ want to move it to obtain full control. That could be halfway or even less. The program will adjust itself so that it maps the full range of control into half the stick travel. You now only have to move the stick half as much! This means that if you move the stick further than that, you will be giving out-of-range values to the program, but I think all programs will clamp these values off with no troubles. I haven't seen any problems yet.

Hi,
can somebody tell me how I know when my subscription expires
of the Atari Classic Mag?
Is it mentioned somewhere on the label or so?

Bo.

I think that is probably less significant than the fact that Star Raiders was only available as a cartridge (to the best of my knowledge) which would be pretty difficult to cram into a Mac under emulation. I've seen Star Raiders cartridges selling for $3, and I'm sure it's worth at least that much - but you still can't get it into your Mac (or PC).

When your 8-Bit comes in, please do buy the Cartridge though... From what I can remember, the cart version ran smoother than the cracked disk version anyway.

I'm not sure about that, but Happy Computing released a little gadjet for
the ST called the Discovery Cartridge that would copy protected disks,
read Mac disks, offered clock, 4 drive support, and more. A friend of
mine has all of the above options, and even slapped some Mac ROMS into his
cartridge as well (for Mac Emulation). Soon after the DC was released,
Mr. Adams disappeared...

>under $40.00. Why. Competition. How does competition come about?
>Yep, you guessed it: open system.

Nope actually. One of the biggest reasons N64 games are so expensive is because their cost of production is so high. Remember, there is a lot of hard physical memory in those N64 cartridges and that makes them costly. Doubt me? Wait til the CD unit for the N64 comes out and matures a bit with CD titles... I estimate you will be able to get games for the N64 that have much more to them than the current cartridge based ones and will cost around $35 to $50. By the way, even at $40 or $45 the CD titles will have a larger profit margin than the cartridge ones.

Cheers,

Jon

It needs a 400 or 800, OR, a special program (translater) that let's you put in a cartridge. Before anyone tries to tell me that there is no translating program for XLs that even let 400/800 cartridges work, YOU'RE WRONG. There is. I have it and done it. If my memory serves me right, the program was written by Tim Patrick (a really neat Atarian in Hawaii, who I had the luck to meet).

Tim, are you still out there? Speak up! :)

It's going to be fun, but those looking to Battlesphere for a 1:1 Star Raiders clone for the 90s should realize that:

There is no resource management in Battlesphere. Energy depletion has more to do with being able to fire than anything else. You have overall hull integrity and when it's gone, you blow up. No partial damage. Your rating has nothing to do with energy consumtion or number of docks. You can't turn on and off ship functions. There is no limping to do with damaged shields or engines.

There is no aft view. There is no gyroscopic scanner screen. There is no X/Y/Z coordinate text display. There is a fore and aft targetting display and distance is roughly color coded but it's pretty vaguely determined. Speed is more difficult to control than it could have been, but you CAN go in reverse. Whether this spoils Alone Vs. the Empire Mode, we'll see.

However, Alone Vs. the Empire does allow you to order friendly fighter squadrons to take on the enemy remotely. In addition to the multiplayer, battlesphere also adds capitol ships into the mix and you can eject and fight as a guy in a rocket pack.

So in some ways it is shedding the simulator and energy conservation aspect of Star Raiders, going more for a simplified 3D netrek (sans planet taking) approach.

P.S. Battlesphere emulates Star Raiders both graphically and via sound samples for its photon torpedos.

Charlie,

You should lay off the bong hits before playing your N64.....or maybe
I should start!

First off, Starfox is a rail shooter designed for 10 year old kids.
The fact that it's in space is all it has in common with Star Raiders.

If you REALLY want to see Star Raiders on a next gen console save up
some of your drug money and get a Playstation. In November Psygnosis
is bringing out "Colony Wars" and THIS is the next gen Star Raiders.

BTW: I have a big screen TV and an N64.

OK, try THIS page:

http://www.tu-chemnitz.de/~sgl/atari/demosind.htm

Here's a modified version of the assckicker demo that makes it more runable in other machines. Looks likes there's a whole bunch of other great demos here too!

It's amazing how many atari 8 bit related web pages are popping up. One good thing about demos is that you don't have to hear a lot of flaming about copyrights. Can we talk about something else - please? Can we all - just get along? :)

The Atari items listed below are for sale.

The computer, disk drive and printer are in excellent condition and are all working. I have not used the cartridges and programs for some time, but I did a quick check and all appear OK. The other accessories have not been checked, but I believe they are also OK. Most items are complete with their instructions and/or manuals.

The system is located in the Northern Virginia area (outside Washington DC) and may be inspected prior to sale.

Please e-mail: crossnet@ix.netcom.com

The auction is now in the once-twice-sold phase!

Welcome to my Ultima/Origin/Infocom auction. I'm getting rid of the last of my classic computer software to make some money for Atari 2600 games and items. If you have any decent Atari 2600 stuff for trade, let me know about it!

Posting to non-marketplace groups will be infrequent, so please e-mail me to get on the update list.

Please read the rules at the bottom. You are accepting the rules by placing a bid.

==========
THE GAMES:
==========

Autoduel (Apple II) w/box, 5.25" disk, ref. card, map <sirthomas> $25
ONCE!

HitchHikers Guide to the Galaxy (Atari ST) w/box, button, <kwekasc1> $20
fluff, brochure, destruct orders, sunglasses, NO DISKS ONCE!

Leather Goddesses of Phobos (IBM PC) Complete <cylar> $20
ONCE!

Moebius (Apple II) w/box, two 5.25" disks, poster, ref card, <xyzzy> $10
Book of Lore ONCE!

Plundered Hearts (IBM PC) Complete <raistw> $24
ONCE!

Ultima IV (Apple II) w/box, two 5.25" disks, reference card, <deth> $17
Book of Mystic Wisdom, History of Britannia ONCE!

Ultima IV (Atari 400/800) w/box, two 5.25" disks, cloth map, <tommage> $21
The Way of the Avatar, Book of Mystic Wisdom, History of ONCE!
Britannia, Reference card.

Ultima IV (Apple II??) one 5.25" disk only, sides C & D <xyzzy> $3
ONCE!

Ultima V (Apple II) w/box, four 5.25" disks, 2 ref cards, <deth> $19
Book of Lore, Voyage Diary, catalog ONCE!

Ultima V (C64) w/box, four 5.25" disks, cloth map, Voyage <sessesses> $26
Diary, Book of Lore, player reference card, quick reference ONCE!
card, catalog

Ultima: Savage Empire (IBM PC) Complete <karl> $50
ONCE!

Wishbringer (Apple II) (shrinkwrapped - thin style gold box) <sreed2> $20
ONCE!

Wishbringer (C64) Complete <andrewv> $16
ONCE!

Zork II (Atari ST) Complete <zzyzx97> $16
ONCE!

RULEZ**********

1. Auction will last until July 31st, 10:00pm Central time. It will
then proceed to a once-twice-sold format, with the status changing
every 24 hours when no new bid is received.
2. Minimum bid raise is $1.
3. Conditional bids are accepted.
4. I will e-mail updates daily, as well as updating Newsgroups (some
more often than others).
5. International orders must pay with Money Order in US funds.
6. Payment must be in US funds, check or Money Order. I may hold a
check up to 10 days, a Money Order will get it shipped in 1-2 days
of receipt of payment.
7. If you would like to get on the update list without yet bidding,
just ask.
8. If you would like to be removed from the update list at any time,
just ask.
9. Buyer pays all shipping, to be determined at the end of the auction.
It will probably be $3 for the first two items, plus .75 per additional
item.
10. References provided on request.
11. If you would like to use an alias, please let me know.
12. I am not an expert on these items, so please ask if something is not clear.
No items are implied, if it isn't listed, it isn't there.
13. In the case of tie bids, the first bid received is accepted.

Wow, what memories playing that game.

Yes, there are some pilots who aren't what they seem to be, ESPECIALLY when you have the sound turned up, and they jump up in front of your windshield.

GEEZUS! I always had a heart attack when that happens! Of course, I "dispatch" them with a press of a button.

And what fun when you let one of those "pilots" in, then you take off...

!!!DANGER!!!!

Tort@springnet1.com (The Enforcer) is really Terry Ortman. Terry was
banned from Fidonet (for life) by the moderators. He then moved to
UseNet. Before you send this guy any money you would be well served to
do a dejanews search from around 6/96 (where he explains "how business
works" and why he was keeeping a guys money and not filling the order) or
email the listserver scammers@pdsig.com

This has been a public service announcement

Ron

-> James Ogawa wrote:
->>Could anybody post contact information for Atari Classic Magazine?

On Tue, 29 Jul 1997, Michael Current wrote:
[lengthy plug for Atari Classics deleted]

That was great free advertising for that particular magazine.
However, speaking as an extremely long-time Atari 8-bitter and as
somebody who subscribed to all of the then-existing Atari magazines
back in the glory days of the '80s, some of us remaining Atarians
have grown more than a mite skeptical about the wisdom of shelling
out full-year (or equivalent) subscription payments for publications
that (to put it mildly) are likely to be somewhat less stable as
publishing enterprises than TIME, NEWSWEEK, or the WALL STREET
JOURNAL.

Don't forget that even the biggest of the Atari magazines (like
ANTIC and ANALOG) never gave any refunds when they went belly up.
They just disappeared and that was that. During the last decade
some new magazines have appeared but apparently most of them have by
now joined the defunct list.

If the surviving publications want to appeal to Atarians who've
been burned frequently in the past, at a minimum they should make
sample copies available for a certain price. Subscriptions on a
per-issue basis could also be helpful in reassuring wary potential
subscribers.

895. copyrights -- new FAQ needed?!

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-02 00:00:00 UTC
From: Al Andalus <erasmus@is.this.a.domain.or.what?.com>
Message-ID: <Pine.GSO.3.96.970802135706.11971B-100000@iglou2>
Source record: 71215

There are some significant differences between the situation of copyrighted software for an obsolete or defunct computer platform and copyright laws for written or published material ("text" as we computerists refer to it).

For one thing, no author of published articles or books ever abandons the field -- that is, the whole reading-and-writing "field" that human beings have been engaging in for over 5000 years -- and thereby takes with him exclusive rights for reading what he's written. An author can't say to the rest of the human race, "I'm no longer going to write anything, so the rest of you can no longer read what I've already written."

Secondly, authors and writers don't "go out of business" the way software producers or marketers do. And even if they stop writing or publishing, they don't deprive the rest of the world of the right or the ability to "support" their products. Regardless of whether an author's published works are or are not still covered by legal copyrights, new publishers may make arrangements to republish the work, literary critics will continue to publish analysis and commentaries, and dictionary publishers will continue to publish. (After all, it might be said that dictionaries contain all the same "code," just in a different presentation.)

Another important difference is attitude. Authors don't abandon the field of writing and say, "World, I hate you and therefore you must not read my published works any more!" But umpteen software producers have officially abandoned older computer platforms, officially stopped supporting products they put out for those platforms, and seemingly have attempted to assign those products to oblivion. Some people and some companies have been outright hostile to the Atari 8-bit community, or the Atari community in general, after they left it.

On the other hand, some software producers were more gracious or generous when they left the Atari scene. Back in the late '80s (which is a decade ago by now!) I recall seeing and hearing reports of some software companies that had supposedly released their Atari 8-bit products to public domain status. Back in the days when clubs still attracted 25, 50, or 100 people to meetings there were occasional reports along these lines, and once in a while a company would post a notice on one of the BBS networks of that era.

What we need now is a public-domain list, compiling the names of software producers who released their products into the public domain, and perhaps also listing other producers and/or their products who

fall into gray areas that might be considered in between public domain
on one extreme and active commercial activity and support on the other.
It's been a while since I waded thru the FAQ files, so if something
like already exists then I suggest it be separated out and posted as
an independent FAQ file. Such a file would make clear who has
abandoned the Atari platform, who no longer provides support, and
hopefully go a long way toward eliminating the controversy over
copyrights and piracy.

> : >> system type thing!!!

Yeah! I have a real good idea for updating Star Raiders on the PC and Playstation. Heck, there's not much to have in SR programming since the 8-bit game had it in 8K plus add some 3D ships and planets and you can fit the entire game in memory without additional CD loads. Plus some elements from Solaris would really make the game special. Doug Neubauer should definitly do the consulting :)

> : Star Raiders for the 90's
> : -------------------------
> : Star Fox 64 for the Nintendo 64 game console absolutely ROCKS !!!

I 'did' play Star Fox 64 yesterday and I liked it much better than the first one. Can't say it's Star Raiders like, but more resembles Solaris on the 2600 except you really can't choose which sector you can warp to.

The only two beefs I have is one, Nintendo expects you to use all the buttons on their fancy control at once and the game characters keep telling you to do barrel rolls and crap. But the Rumble Pack...and don't let anyone tell you different...is the most useless video game accessory ever devised. You can hardly feel it and when you do it's very distracting. Pardon me, but I rather have 'good gameplay' (the very bane game industry keeps trying to squash) to get me inside the game then some vibrator. If you want a good rumbling...hook up a big subwoofer near your seat! :)

> development.

Don't hold your breath for Battlesphere...the Jaguar dies a long time ago. Perhaps if it had came out even last year things could have been different but it's not. I can see Telegames putting it out along with Super Breakout 2000 but the only people I see playing new games on the Jag are those who write their own programs with the Jag server. Sorry, but as a

long time Atarian I know when to expect something coming out and when it's forever vaporware. (Prove me wrong and I'll really be happy).

898. 3rd Northern SAM & Spectrum Show - incorporating 8 Bit Show

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-02 00:00:00 UTC
From: NSSS <nsss97@usa.net>
Message-ID: <33E41B65.4FEA@usa.net>
Source record: 71218
Cross-posted to: comp.sys.amstrad.8bit,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.msx,comp.sys.oric

Hello all,

Just a quick posting of an event you may be interested in....

The Third Northern SAM & Spectrum Show - Incorporating 8-Bit Show

The first two NSSS shows have been so popular that we've decided to throw the doors open to all 8-bit owners this time!

Whether you be an ordiary user, or any sort of support service (magazine, software publisher, jhardware creator, etc) then we'd love to see you there. And this time, due to the success of the earlier shows, we've managed to reduce stall costs for anyone wishing to book one!

The show is held at Wetherby, Near Leeds - within easy transport of National Express coach, local buses etc. If you're unsure of where to go, sending an SSAE will give you directions.

At previous shows, we've had all the top names on the SAM & Spectrym scene; Fountain PD Library, Crashed, Impact, Quazar, Alchemist Research, Persona, Format, Fred, Sintech, Blitz Magazine, Flexibase, SD Software and more .... and they've all been invited for this time around too.

So don't miss out! Be there on the 20th September 1997.

For more details, call George on: 01937 583827 (after 6pm), fax 0161 476 3377 or send an SSAE to: NSSS, 32 Barleyfields Road, Wetherby, West Yorkshire, LS22 6PW.

I will ship this box of Atari 800 software to the first reasonable offer. It's been in the garage a long time, so no guarantees, but it is all original disks and boxes and most appears to be in good condition.

Alien Addition, really cool sealed box
Math Blaster Math
Mickey in the Great Outdoors
Word Flyer, Electronic Arts
Grandma's House, Spinnaker
Snooper Troops Case #1
Snooper Troops Case #2
In Search of the Most Amazing Thing
Dance Factory, Fisher-Price Cartridge
Spelling in Context 1 & 7
Storybook Addition and Subtraction
Storybook People and Places
The Factory
The Pond
Subtraction with the Tink Tonks, Mercer Mayer
PuzzlePanic, Epyx
Millionaire Stock Market Simulation
Astrology, Antic Software
D-Bug, Electronic Arts
Learn to Read, disks 1-6
Book: Computers for Kids, Atari Edition by Sally Greenwood Larsen (kid's Basic programming manual)
Xerox copy of Star Raiders documentation

Please reply only to: damon@jump.net
I do not monitor this newsgroup.
This is the last of my Atari 800 and ST software I have left to sell. I sold all my stuff through the newsgroups. One man in Japan bought all my old games. The shipping cost more than the games, but he was thrilled! I do miss the old Atari days, but I am not a collector and I want to keep this stuff in circulation.
Thanks,
Damon Ginbey, Austin, TX

901. How to pogramm a mouse driver?

Newsgroup: comp.sys.atari.8bit

Howdy !

I'm asking me how the mouse system works internally and how to controll the data flow. I'm not sure about my exact problem, but I want to program a working menu system with a mouse option. I don't want to use a driver of somebody else. I need some instructions or at least some hints how to manage this task. It can't be so hard, isn't it?

902. B & C ComputerVisions Closing Store in December

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-03 00:00:00 UTC
From: who@knows.com
Message-ID: <33e4f49f.25981147@news.supernews.com>
Source record: 71125

I was just on the B & C ComputerVisions web page http://www.myatari.com and I saw this information. Yogi's archive is great, but we should try to support the remaining Atari dealers as best as we can.

News flash: We our planning to close our retail store in December!

Please note that we will continue supporting Atari user via mail order/Web/E-mail.

Rents in Silicon Valley are skyrocketting. Our current lease is up August 1997.If we go on a monthly lease we will be paying $1000 dollars more a month. Due to the decrease in sales and the massive increase in rent we are forced to close our store location in Santa Clara. Our landlord has made us an offer below local market rent, but,we still can not afford Silicon Valley anymore. We are searching for a new location outside this area and hope to find it and move by the end of the year. If everything goes as planned our mail order customers may experience slight delays in delivery during our move, while, our walk-in customers will have to change their methods of purchase to Mr UPS. We are sorry for the inconvience and will be doing everything we can to stay in business as long as we can. Stay tuned for updates. Atari lives on.

903. Best Electronics Catalog

Newsgroup: comp.sys.atari.8bit

I saw this on B & C ComputerVisions http://www.myatari.com

Another News Flash!!!

The Best Electronics "Catalog" has arrived!!

You will not believe your eyes. This is the catalog to end all catalogs. There never was and never will be another Atari catalog like this one. Brad and his workers have spent three years putting together the number one reference of all time. It has hundreds of pictures and diagrams covering all Atari products even those that never came out. This over 300 page catalog even gives you the pin-out of all of the ports on Atari machines. Also there are serveral thousand parts with descriptions and prices. This is more than a catalog this is a general reference book for Atari users.

Order direct from Best Electronics or get your copy from us today.

Only $7.50 each.

After 36+ Months of Intense Labor our Over Due Baby/Rev. 10 Best
Electronics All Atari Parts/Reference Catalog has Arrived.
This New Rev. 10 version Catalog/Atari Reference Manual is Over 4
Times the size of our last catalog (June 1991) and has Many
Interesting New Features! Just to Tickle your interest here are just
some of the Features: A Catalog Index!, Easy to find Item/Product
format, 55+ Best Technical/Repair Tips covering ST, 8 Bit and 2600 5200/7800
Atari Products, 90+ Best Informative Information Tips, Over 330+ Pictures of Atari
products (last catalog had 137 pictures), Over 2000+ New Atari part Numbers/Products,
Expanded Listing and Descriptions of 8 bit Software Titles, An Atari Memorabilia
Picture Museum and Complete Atari I/O Connector Specifications on just about
every Atari product made! As we start an Unprecedented 15th Year in the Atari
Computer Parts business, Our New fully Computerized Accounting
System has had all of the bugs worked out, so each customer will Now have a
Unique Customer Number for easy Item Inquiries, Order Processing, Invoicing also
we can efficiently Track our 4,000+ Line Item Inventory! The Unique Best
Catalog which is Now Shipped World Wide to Atari end users and Dealers alike, is
priced at $7.50 (Actual Cost to Produce only) (California residents must add
your local 7.25% (.54), 7.375% (.55), 7.50% (.56), 7.75% (.58), 8.25% (.62) or 8.50%
(.64) cents sales tax to the total and $3.00 U.S. Priority Mailing. So if you would
like to get a hold of a Hot off the press copy of our catalog, just
send a check to

Best Electronics,
2021 The Alameda St., Suite 290
San Jose, CA 95126.
We can be reached by telephone at

908. New User, Emulator Help FAQ v.2.0 is here

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-03 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5s152m$hi1$3@nuke.csu.net>
Source record: 71131

I'll post it when I get a chance (unfortunately, sending files with "tin"
seems kind of impossible; I'll have to hack it, I suppose :))

Come and read it:

http://zippy.sonoma.edu/kendrick/nbs/new_and_emu.html

There's a Spanish version of 1.5 available, as well. You can also
get a text version via e-mail by sending me a message
(kendrick@zippy.sonoma.edu) which contains the subject:

send emulator faq

It should get send immediately. (procmail is cool! :))

: normally i run the ataris off a regular tv,
: however, recently i purchased a rgb monitor w/ av jacks.
: what sort of cable do i need to connect them? where is it available.

what kind of atari do you have? 2600? 5200? 400/800/800xl ? I just built a monitor plug for my xl using an old keyboard and rca plugs. Check the faq for details on the monitor plug. What I have found is I only needed one ground for video, but I didnt need/want a ground for audio (kept buzzing) but that could just be my setup. Use composite out, gnd, and audio out. I have no idea which other systems have the monitor plug, maybe that info is also in the faq.

Good luck,
Jeff

913. Is there a newer version of Xl-It! (>0.20)?

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-03 00:00:00 UTC
From: svillase@dii.uchile.cl
Message-ID: <5s1i8k$nuj@dcc.uchile.cl>
Source record: 71136

Hello everybody:

Is there a newer version of Xl-It! anywhere thet is greater than 0.20?

I find this emulator incredible, as it has the highest compatibility than any other emulator, it is fast, has the best sound system found (it is really like a real atari) and... it is free!!! What else can you expect?

The fact that Markus Gietzen's Web site is not accessible anymore (I don't know the reasons for this), and I cannot find any more information about the development of Xl-It! anymore.

Any information, please send it by e-mail.

Thanks in advance,

I need a bit of help with a dead 1050 drive problem.

As far as I knew, the drive was working fine, although it is a 2nd drive which I haven't used for many months.
However, I went to use it yesterday, and it was dead. At first the power light came on but it did nothing else. So,
I thought my upgrade board (a British Happy clone) may have come out. I removed the metal shield to check all was in
place and tried again. This time the drive was completely dead, no power light at all. I tried replacing the upgrade with
the original chips, but still nothing. Any body any ideas? Please email dgs@clara.net if you can help.

Dean Garraghty.

Markus stated that development past 0.20 would be slow because he's
involved in a commercial product. The site seems to be down for the
summer (it's a college computer) and should return soon.

Does anybody here have the URL for the echo?

I went a year ago and it was great fun. Plenty to interest CPC users,
but a bit lively for the green screeners, if you catch my drift.

There are a number of "serious" SAM programs, especially in the DTP area,
which leave CPC stuff standing but which might inspire some further CPC
software developments.

Of course, this is being held the week after the WACCI do at the Walsall
footy stadium on Sunday the 14th September. Just how much excitement can
a CPC/PCW user take in one month?

918. PCXformer, can't switch disks in D1??

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-03 00:00:00 UTC
From: mikeg@sashimi.wwa.com
Message-ID: <5s254t$1iu@sashimi.wwa.com>
Source record: 71141

I just downloaded a copy of PCXformer and can't for the life of me figure out how to switch a disk that is mounted in D1 in order to insert another disk. I run it like this:

xformer -n somefile.atr

Everything would work find and the program I am trying to run would start fine. Unfortunatelly, this program I am trying to run needs to create a data disk. It tells me to insert a blank disk into the disk drive (D1). How can I get somefile.atr to stop being the disk in D1 (i.e. unmount it) and somehow put a blank file into D1 (i.e. blankfile.atr).

Thanks for any help!

Mike

Mr Maddog (mrmaddog@microserve.*NOSPAM*.org) wrote:

: Don't hold your breath for Battlesphere...the Jaguar dies a long time ago.
: Perhaps if it had came out even last year things could have been different
: but it's not. I can see Telegames putting it out along with Super
: Breakout 2000 but the only people I see playing new games on the Jag are
: those who write their own programs with the Jag server. Sorry, but as a
: long time Atarian I know when to expect something coming out and when it's
: forever vaporware. (Prove me wrong and I'll really be happy).

I realize that this discussion has drifted out of the 8-Bit arena, but I really want to clarify this issue. I chat with the developers of Battlesphere periodically, and they seem determined to complete the game and have it released. They are also interested in porting it in the future. That aside, there are plenty of people playing Jaguar games - probably nor more than ever. Every Kaybee toy store in the state has Jaguars for $40, a system setup in the front of the store for people to play, and a slew of games for $12. They are selling too, because I've gone into the stores periodically and the stock is always different. From what I understand another chain (Electronic Boutique?) is carrying all of the new Telegames titles as well.

I don't expect that any of this will change the Jaguar's demise or spur new development or anything like that, but when Battlesphere gets out the door, there will be stores that will probably carry it. More significantly perhaps, Battlesphere is highly anticipated; being one of those eager individuals, I will be buying at least four cartridges for myself (networking, you know).

Aloha,
John Perez - jperez@hawaii.edu

> will SUE YOUR A**) then let me know and I'll coordinate...

First of all, SR is shorthand for Star Raiders because I don't feel like
typing the whole thing out again....and if I really am working on a
professional remake project, then I go straight to JTS and not 'you'

So when you do see Doug Neubauer, please do ask him about the possiblity
of a updated version...unless he got a operation and is now named Debbie.

> : I 'did' play Star Fox 64 yesterday and I liked it much better than the

> : forever vaporware. (Prove me wrong and I'll really be happy).
>
> Then why are you on an orphan system newsgroup if you disregard these
> people?

Because unlike some people I can name right now, I am a realist. If
Battlesphere does come out and I hope it really does soon then great. But
the Jag will always be for a niche market like all other Atari products
and I like it like that. Especially when the idiot Tramiels won't
screw it even further to the ground! Since someone else who knows his
stuff told me that they still sell Jags in stores and will carry BS(wanna
sue me for that?) then I intend to buy it.

But someday, I hope to do a remake of "Star Raiders" and it will be very
professional and that's the bottom line...

From: David@Classic
Message-ID: <5s2t9t$nm8$9@mhafc.production.compuserve.com>
Source record: 71152

For Sale: Complete Atari System Includes:
(1) 130XE
(1) Non-functional 130XE
(1) Happy Drive w/ software (Happy Drive has 3 switches and
indicator lights)
(1) XF551 Drive *
(2) Atari 1050 drives
(1) XM301 Modem
About 300+ disks and carts full of software, most labeled
(1) Magnavox Monocrome Computer Monitor 80 with speakers

Not including the Monitor and the software all this hardware
would cost about $850 from B&C Computer Visions.

I am asking $120 for bundel (includes shipping), plus $30 if you
want the monitor.

* The XF551's power input is a bit worn, the board inside has a
small crack. Nothing a simple soldering gun can't fix.

Other than the XF551, all is in great condition

From: mike larue <bandit@cdsnet.net>
Message-ID: <33E53EC1.112@cdsnet.net>
Source record: 71153

It is very simple, atleast it was for me using an atari ST mouse, I wrote a program to read the joyport, and then I used the paddle reading. I was able to make it work, but never went past the point of finishing.

The IBM serial mouse I was never able to get it working until I changed the wiring of the mouse, so use the ST mouse for the easy way...

934. Sorry, "Asskicker" is NOT "Doom!"

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-03 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5s1idrrim1@nuke.csu.net>
Source record: 71157

I just checked out AssKicker (I had seen part of it before, I just forgot what it was called :))

While the graphics and effects ARE impressive, and probably never-before-seen on the Atari 8-bit, they are barely comparable to "Castle Wolfenstien 3D" (ID's title before "Doom")...

Four things pose problems:

(1) Still too slow! :(

(2) It's stuck in a maze; these other games have large, wide, open areas. (So this game is more like "Amazing Maze" or "Maze of AGDAGON" than any of the "Wolf3D" or "Doom" games.) :(

(3) Where would the enemies go? How would they move?

(4) Would you actually be able to POINT in a non-90-degree direction?

So, while I'm not denying that we're getting ever-closer to that "Doom" for the 8-bit, I feel more needs to be done... especially in the gameplay aspect (not just the looks and texture-mapping and lightsourcing and stuff like that.)

Oh... did I mention I hated the music? ;)

935. Helicopter game idea - HELP CODE IT!

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-03 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5s2sd2omm1@nuke.csu.net>
Source record: 71158

Hehe... as with all my ideas, it's pretty much a stolen one, though. :)

Have any of you seen this one relatively old (late 80's or early 90's)
arcade game when you're a helicopter flying through a city shooting at
lots of different things. (I believe the version I played had a wiggly
seat which reacted to my directional controls.)

1/2 of the game is played in first-person perspective, the second half
is played from looking above, a la Xevious. The cool thing about it,
though, and what made it majorly different from Xevious, was the
skyscrapers and stuff were 3D. They weren't polygon 3D. More like the
OutRun "lots of the same sprite" 3D.

It looks kind of like this: (imagine more skyscrapers on the right :))

```
##########  |
##########  |
###########
###########  |
##########  |
######
=======
#######  | O |  <-- Hello! I'm a tank!
########  ====\==
########  |
|
########
###########  |
###########  |
###########
##########  |
```

You get the idea?

Well, I started trying to code such a thing in Action! It actually
works MOSTLY right, except some 'pop-up', and, well, it's REALLY SLOW. :)

But it is still cool to fly in 3D above these things (you can fly up/down
AND left/right in my little demo, and I believe that's how the actual
arcade game was...)

I'm thinking I'll release a .EXE demo plus the Action! source-code and
let some of you REAL coders out there make this into a fast-action
shoot-em-up for all to enjoy. ;)

Anyone up to it? :)

>
> Gimme a break. Pirate arechives are not the savior of old software.

Maybe. In fact, yes, that's true. But I think it is a good
idea to make sure that the old titles don't die as one disk
after another eventually dies of bit rot.

(To be honest, as a software guy myself, once commercial sales stopped,
and once my royalties were no longer ever going to come in, I'd be
honored and pleased if people kept my work alive rather than let it
slowly disappear over time.)

I agree that as long as the software is commercially available (even
if hard to find), piracy of such software is wrong. But I'm not
going to condemn anyone who copies software which is not commercially
available anywhere, since in that case there's clearly no revenue
or royalties to steal from *anyone*.

I agree with this, I had a C64 (had a 2600, and a 600XL before th commie)in
the '80, nowadays I collect every 8bit system I can get my hands on.
I found an 800XL a year ago, after two years of hunting (I live in
Belgium, Europe), but I can't find any carts for it. I would love to play
games like Star Raiders(my 2600 fav), MULE...but there's no PAL atari
software in the second hand or thrift markets around here.
RESULT of all this, I have the speccy and the C64 and Amstrad for wich I
could get complete software collections easy (well known HV CD's for the
C64, !legal! speccy sensations CD 2 for the spectrum, !legal! Stella from
CyBeRpUnKs for the 2600/supercharger, etc, etc, etc,...) permanently set up.
But the 800XL ---> Boxed, in the closet (What a waste :( ).
Why isn't there an initiative from this newsgroup or whoever (atari??) to
do somethings like that for the 8bit Atari's, or will the software go
forever when the floppy's will have more bad sectors than good ones after
all this year?

I was just on the B & C ComputerVisions web page http://www.myatari.com and I saw this information. Yogi's archive is great, but we should try to support the remaining Atari dealers as best as we can.

News flash: We our planning to close our retail store in December!

Please note that we will continue supporting Atari user via mail order/Web/E-mail.

Rents in Silicon Valley are skyrocketting. Our current lease is up August 1997.If we go on a monthly lease we will be paying $1000 dollars more a month. Due to the decrease in sales and the massive increase in rent we are forced to close our store location in Santa Clara. Our landlord has made us an offer below local market rent, but,we still can not afford Silicon Valley anymore. We are searching for a new location outside this area and hope to find it and move by the end of the year. If everything goes as planned our mail order customers may experience slight delays in delivery during our move, while, our walk-in customers will have to change their methods of purchase to Mr UPS. We are sorry for the inconvience and will be doing everything we can to stay in business as long as we can. Stay tuned for updates. Atari lives on.

One of the best BBS systems for the Atari 8-bit still available. BBS Express! Professional(tm)
Version 5.0b. Full IBM Ansi Compatable, system is a single BBS system or if you have a MUX system from Bob Puff, fully multiline compatable up to 7 lines multiline BBS system.

System requirements...can be run on with an 800XL, and a Percom or other double density disk drive system 4 drives required..message bases and download capabilities depend upon your setup. Recommended system...800XL, 130XE or upgrades computer. Hard drive system of your choice..BBS program has the ability to swap MIO hard drives to an unlimited depending upon (only) your budget for the system..Utilities for the Black Box can be ordered seperatly...

Some features include, Mux Time...you do not need an R-Time 8 cart with this software, Pro_Term..call out availability directly from the BBS..Full Networking availability with software to do standard networking (high phone bill) or Hi_Speed Net! Arched networking which reduces phone bill drasticaly...or if you are a Internet subscriber..you can reduce all costs and Network your message bases through the Internet at no additional cost.

Internet special...Price! $30.00 plus $4.00 shipping/handling...

24 hour Support board up and running since the early 80's..The Repair Shop BBS
801-967-8738...Visa/Master Card welcome..Internet or on a secure 8-Bit BBS system..

Now is probley the best time to get a multiplexer, there at there lowest price $150.00 It let us 8bit users have a LAN or 8bit Mainframe in our homes. At this time the only software that has been writen for the MUX is BBS express Pro. Needed are some games and perhaps a Netwok GUI system. Programming for the MUX is a snap, all the info comes with it, data is send threw the system in packets, with check-sum and high speed. We are Lucky to have such a system for our 8bits.

If you can transfer the data to an atari disk first then upload it to a local BBS. Call back with your PC and download it. You may have to make arrangements with the sysop first depending on their pollicy regarding up and downloads. The reason I say transfer to atari disk is, I don't remember any software allowing you to upload from tape.

Or, transfer to an atari disk and use a happy drive and their ibm transfer software to convert it - then find a pc that has a low density 5.25" drive.

Any help? Anyone else got any ideas?

I remember a disk full of PD terminal software that came with it, but it's better to use Bobterm, or maybe Keith Ledbetter's 1030 Express. I ran my first BBS with a 1030 many years ago. Since it couldn't detect a telephone ringing, I used a ring detector from Radio Shack that would normally turn on a light switch for deaf people when a phone rang. I pulled it apart and connected it to a joystick cable, so the BBS program would look for a fire button pressed to answer the phone. Then the XM301 came out which is 1030 compatible and could also detect the ringing. They are both only 300 bps, so by today's standards, they're extremely slow. But they were great fun at the time. I remember watching with anticipation as a BBS welcome screen was slowly formed using ATASCII character graphics. I also remember downloading an 8K file and it taking a little while:).
Those were the days my friend. We thought they'd never end. We'd sing and.....

Where is a SIO2CAS program to dump cassettes to .CAS files, but i'm not sure how many of the emulators support them, except APE. There is a stand along CAS2SIO program that uses the SIO2PC cable, both are available on the net.

If Xformer wont support the native cassette format, you will need to copy the tape information onto disk files, and then turn that disk into an ATR or (ack) XFD.

Unless its a boot cassette, in which case you have the option of using .CAS format, cracking it, or chucking it.

If you don't mind doing some custom mouse-building, the easiest way to do the programming is to use the PADDLE functions. You didn't specify for what language you're going to write in, but it's easy enough to write a quick BASIC program to work a menu with the paddles. I would guess most other languages would be just as easy, especially in Pacal or Action!

Still, it sounds like you think the 8-bits have a built-in mouse system, which they don't. Are you sure you're in the right group? Maybe you're looking for info on the ST computers?

Trying to help,
Steven

Wholehearted agreements!!! I've been trying for a few weeks now to
find out if the Pirates Treasure Chest has gone public domain, since
so many of you have requested a copy of it from me, and I'm not having
very good luck. I know that a company bought out Gardner Computing
and changed the name of the PTC to the Hacker's Treasure Chest, but I
haven't been able to get in contact with that company (who's name
eludes me at the moment).

A list such as the one that Al suggests would be INCREDIBLY helpful.

Others would suggest that those like myself are just being paranoid...
You're right! I couldn't even afford a lawyer, much less pay a
settlement for copyright infringement, so until I get something in
writing, I will not, under any circumstances, copy any of my software
for anyone when I don't know for certain if it is in the public
domain.

The big question is, how do we go about getting this list?

Dg> power light at all. I tried replacing the upgrade with
Dg> the original chips, but still nothing. Any body any ideas? Please
Dg> email dgs@clara.net if you can help.

Although this is a little bit tricky, it should work.
I use the same method to "repair" other equipment of which I have 2 or more.
Take your working drive, replace 1 ic with 1 ic of your defective drive.
Does your working drive still work? Yes, then the replaced ic is ok,
if not the replaced ic is defective! Proceed this way, until you
processed all ic's of the defective drive, because multiple ic's
can be defective.
If you repaired, you can reinsert your Happy clone.

Hope this helps.
Regards, Bo.

>FAR cheaper than $150! ;)>

I agree, you cant beat the price of a paperclip and two wires, and I would like to play some new games viva the game-link. But the Mux has a lot of horse power under the hood, Like 8 players online in a frenzy, or 7 playing in network mode while the BBS is running on slave 1... How about a Star Raiders clone for the gamelink ? sounds cool huh? where you can either play as a team or go head to head in a death-match mode 8^) Oh I have ran your Mux-chat util, and its a lot like Irc chat. Hey have you thought about updateing your cardstack program to use - Interlace pictures or HIPS and CMC or MPT music ?? From what I remember your program used GR-8 or koala and music from the
Pokey music player.

: He was saying they are not the SAVIOR of old software.

I'm not sure what the real issue is here. I for one am glad that someone is taking the time to keep and archive of this stuff. The majority of my software for the 8-Bit has failed over time, and an archive like this means that I can get it back.

I think that it is more important to save this software from disappearing forever than to argue about the legalities involved. I would guess that at this point, most 8-Bit authors would be pleased to know that someone thought enough of what they created 15 years ago to try and keep it alive. I know that I would. Likewise, I would think that it would be flattering that people would want to use my software this long after it was released.

Any 8-Bit authors care to comment?

All I know is that I paid for games like Jumpman, Zombies, Spelunker, Caverns of Callisto, Raid over Moscow, and Ultima III (which you can't even get for the PC anymore!) and these archives could allow me to play them again. I certainly can't get replacement disks from the original publishers.

Aloha,
John Perez - jperez@hawaii.edu

Hey im new to the group, please dont point me too any faqs. im simply looking for some bbs's to dial up with my "new" system i found at the thrifty. Hopefully these bbs's will have some good stuff, Back in the days there was always good cracked software available, how bout now? I dont want to argue bout legalitites, We never had those debates back in the days, well at least i didnt, i was only 13. Basically i want to play zork and any text adventure games, where can i find em??

971. FS: 800xl, cassette recorder

Newsgroup: comp.sys.atari.8bit

From: spaceman@Glue.umd.edu
Message-ID: <5s7m0kvoh1@hecate.umd.edu>
Source record: 71091

I have an old 800xl with no power supply, box, or manuals. I made a makeshift power supply for it and it does seem to work ok, though. (I can include pin out information if you need it.)

I also have a very small Atari cassette recorder.

I'm looking for any offers on the above equipment; I prefer to sell it all together, and I will throw in an Atari flight simulator program that is on disk in the original box. Buy pays shipping.

I found an Atari Sm124 monitor at a 2nd hand store today...thought I could use it with the 2 130 xe's that I've got...guess what, wrong DIN connector...I therefore assume it's for a 1040? ...can anybody tell me what it's for...what the pin-outs are on the 13 pin Din connector...& is it colour or monochrome...I paid a whopping $4.99 CDN...I've got 7 days (6 not counting today) to take it back for a credit....however, if I can rewire it to run from a 130XE or an 800...I'll give it a go

```
-----BEGIN PGP SIGNED MESSAGE-----

I've been running some of the European demos on my 130XE and they
amaze the hell out of me up to the point a teensy bit too long
interrupt routine crashes the system. I would like to add a PAL ANTIC
to my system so I can watch these programs jitter, clip, and crash
free but I don't want to lose the ability to run strictly NTSC
software or have a second 130XE taking up limited living space. Has
anyone ever heard of or come with a switchable ANTIC swap? What I
have in mind is dingus that accepts a PAL and an NTSC ANTIC and allows
switching between them. I don't insist on the ability to do this with
the system turned on. Must be realistic.

Come to think of it, a well designed upgrade could prevent switching
when the machine is powered up. If no such upgrade exists then does
anybody know what the main obstacles are allowing one to work. I
would like to attempt designing one if I can determine the range of
problems I'll run into.

Congratulations on being one of the few software developers to actually
come forward and state a position on this. I had almost come to the
conclusion that you guys were not going to be found.

> I agree that as long as the software is commercially available (even

Of course, the tough thing will be to determine what is and isn't
available. Long after sofware companies say they have none in stock,
some retailer or other might have an item or two in his clearance bin.
That makes it difficult to determine what is or isn't available.

BTW, I happen to agree with you about the piracy thing. Please don't
name names, but have you known any developers who could be persuaded to
release what they have long ago stopped receiving royalties on to the
public domain?

Actually, when the bootlegged/proto cart "Last Starfighter" came around, it was actually pretty playable. But when it was officially released after Atari lost the license to LS it turned to crap.

I like the early star raiders carts that would do weird things when they overheated.

Why don't you print one yourself? At Kinko's one can print a t-shirt for
a fairly reasonable price.

Ok, here's the situation: I can use my ancient Mac Classic to ftp software and can download it to the hd. I want to use it to get PD files for my 800xl. How can I get the files from my Mac to the Atari? Is it possible? I've got an sx212 attached to the mac(no foolin') and a xm301 attached to the 800xl(i plug the atari into the sx212 when I want to use it with a vt100 emulator). I think the first thing I'd like to get a hold of is a working kermit emulator so I can just download directly to my Indus GT.

Does anybody know where I can get a download a kermit emulator, preferably on the east cost. I lost the number for Toad Hall BBS in Boston. Blah. Does anybody know it?

no, I am not sane. I just want to put off buying a "real" computer as long as possible. The mac was donated a few months ago when my sister-in-law upgraded to a '90s system. Up till then it was atari all the way(over 15 years with the same system)

WOW! Did this ever generate some e-mail. Thank you ALL for your interest. Here's the scoop:

According to Shadow, he has a "distribution copyright" on the Pirates' Treasure Chest, as well as a few hundred other titles. This simply means that he has put a copyright notice on the software that says he has the right to distribute it, but it is not a registered copyright with the Library of Congress.

I've heard from others that Gardner Computing created the Pirates' Treasure Chest out of public domain software, some of which were type-in programs from Compute magazine. Therefore, I can't see any reason for these programs to remain under someone's copyright control.

What I question is his legal right to stop this software from getting onto the internet. If there are any copyright lawyers out there, I'd love to hear from you. I would especially love to hear from anyone who worked at Gardner Computing circa 1984!

Check the power supply first. But in case the bad 1050 took it out, DO NOT plug in the supply from the good 1050. If the supply is dead, the 1050 probably has a shorted rectifier or voltage regulator. If you can get the power supply open, you can replace the 2.5amp pigtail fuse. The 1050 could be another matter.

Let me know what you find.

Except of course that they 1) Blew the hyperdrive, 2) Blew the
docking sequence and worst of all 3) Made the game mission-based
with medals and all that nauseating Wing Commander crap.

It also has the lamest excuse for a graphics engine I've ever
seen. This thing hiccups in low-detail solid-fill mode on my
P5-200MMX.

OTOH it did have capitol ships, diverse but redundant weaponry, and a
nice sector map. I believe they now have an online edition. It's
probably worth the $5 you'll pay for it as a result.

> Star Raiders for the 90's

> Star Fox 64 for the Nintendo 64 game console absolutely ROCKS !!!

All I can say is that I think StarFox 64 is an absolute disaster
but you can read that post on r.g.v.a. Recently, I found out why
it seems so soulless to me. Argonaut Software wrote some of my
favorite games: Star Glider, Star Glider II (very Star Raiders-like
actually), Carrier Command, and Starfox. Starfox 64 was not written by
Argonaut Software but rather by Shigeru Miyamoto of Mario fame. All I
can say is "Leave the platformers to Miyamoto, Leave the shooters to
Minter!"

I thought that was part of the game. The original instructions said that the more slowly you made your moves, the better the computer thought out its moves. It puts *real* pressure on the human player.

Message-ID: <01bca2eb$9c7bbae0$654437a6@default>
Source record: 71110

Hi

First, I'm not a lawyer. Just a software developer who has some experience protecting my own software...I would like to see someone who makes a living protecting software post a response too. Anyone from the SPA (Software Publisher's Assocation) out there?

Way back (5-7 years ago) Compuserve sued a California BBS because the sysop posted Compuserve's mac libraries in his own bbs and placed ads advertising "compuserve's mac libraries at a fraction of the cost". In other words, the sysop downloaded all of compuserve's mac files and made them available through his own BBS. All the files were PD or shareware and meant to be distributed free. Compuserve won the lawsuit (to the frustration of many onliners) because the court agreed with Compuserve that even though the files were free, Compuserve still owned the "whole" contents...meaning that the sysop could not claim the software to be "compuserve libraries". They could be distributed separately, but no one could distributed them as "compuserve libraries" or the same contents.

To me, this means that any files meant to be distributed free, could be done, as long as you don't mention them belonging to a collection, or distribute the same files as a collection with a different name.

In other words...lets say I downloaded File1, File2 and File3 from the internet. I could call my collection of files "Fernando's Files". Someone else comes along and gets the same files from the internet and sells them as "Fernando's Files at half the price". I could sue. I could also sue if they distribute File1, File2 and File3 together as "Joe Blow's files". Why? Because they are the same mix of files that I distribute as "Fernando's Files".

So, to answer the question about Pirate's Treasure Chest, the PD and shareware files in the "collection" *can* be distributed separately, but you cannot claim them to be part of the collection, and you can't distribute the same contents together.

What do you all think?

Fernando

991. Game screen shots and manual archive (08/06/97)

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-07 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <33e96708.28639487@nntp.ix.netcom.com>
Source record: 71111
Cross-posted to: rec.games.video.nintendo,rec.games.video.sega,rec.games.video.3do,comp.sys.cbm,comp.sys.atari.8bit,rec.games.video.atari,rec.games.video.sony,rec.games.video.cd-i,comp.sys.ti,comp.sys.tandy,rec.games.video.classic

I have just added a game manual archive to my WWW site.
There are 857 manuals for the following systems:

Atari 2600, Atari 5200, Atari 7800, Colecovision, Mattel
Intellivision, Magnavox Odyssey2, RCA Studio II, GCE Vectrex,
Fairchild Channel F, Commodore Vic-20 computer, Atari Lynx,
NES, and TurboGrafx-16 / TG CD / Duo.

In addition to looking for more game manuals for the above
systems, I am also looking for manuals for the following systems:

Emerson Arcadia 2001, Bally Astrocade, Atari 8-bit computer,
Commodore 64 computer, Texas Instruments TI 99/4a computer,
Radio Shack Color Computer, Tomy Tutor computer, 3DO, SMS,
Atari Jaguar, Sega CD, Sega 32X and Philips CD-i.

If you have any additional manuals for the archive, please let me
know (and *please*, send a list first!)

Other systems will be added when they are no longer supported by
their manufacturer (that means, for the time being, no Game Boy,
Game Gear, Genesis, SNES, N64, Saturn or Playstation). If you
have any game manuals for these systems already typed / scanned
in, please let me know. I will be happy to accept them now for future
inclusion in the archive.

In addition, there are already 1669 ORIGINAL game screen shots
on-line, for the following systems:

Atari 2600, Atari 5200, Atari 7800, Colecovision, Mattel
Intellivision, Magnavox Odyssey2, Emerson Arcadia 2001, Bally
Astrocade, Atari 8-bit computer, Commodore 64 computer, Commodore
Vic-20 computer, Texas Instruments TI 99/4a computer, Radio Shack
Color Computer, Tomy Tutor computer, 3DO, Sony Playstation, SMS, NES,
SNES, TurboGrafx-16 / TG CD / Duo, Sega Genesis, Nintendo 64, Sega
Saturn, Atari Jaguar, Philips CD-i, and Nintendo Game Boy.

More will be added as I have time. Eventually, I will have my entire
collection on-line (hopefully before the turn of the century :)

Next, I'll probably finish up the Atari 7800 and Atari 2600 sections.

If this is of interest to you, the URL is:
http://www.io.com/~vga2000/

Michael

P.S. And before anyone else asks; if the game isn't on one of my FS/T lists, it isn't FS/T :)

992. What is an Atari 800 XL worth?

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-07 00:00:00 UTC
From: Daniel Woodard <woodardd@dma.org>
Message-ID: <5sc5bk$1ie$3@sally.dma.org>
Source record: 71112

I just saw an Atari 800 XL at a thrift store for $17. It looked
like no one ever even used it. It is in the original box, has manuals,
but is missing the power supply.

I heard some sort of rumor that you can program Atari Jag games
with one of these. Is this true?

Also, does anyone have specs for the system? What is the
difference between this and the ST?

Is there a version of Wizard of Wor that will run on this system?
How about the rpg Towers?

I know that is a lot of questions, but I don't want to plunk down
nearly $20 for it if it isn't a good system, especially considering that
I'd have to track down a power supply for it somewhere. (it has a strange
connector that looks like a keyboard slot on the IBM)

Thanks,

Dan

Hi!

I am searching the following software for the Atari 400/800:

- Action! (programming language, cartridge)
- Nautilus (Game, Disk, from Synapse)
- Protector (Game, (rescue people from a volcanic eruption))

I will pay well for this items, if they are original and
in good condition. Costs for oversea shipping no problem.

Other lists with old Software for the Atari 400/800 welcome,
also lists with european Atari-Hardware (PAL, 220 V AC/DC).

Likely it was thought to be a feature, but sadly you could cheat too easily with it. Simply keep pressing Start a LOT when the game first gets set up, and the Sovs will just sit there doing nothing.

If you keep doing this until the spring, you have supplies, firm ground, and scattered Sov forces. You can burst through their lines just like you do at the beginning of the game, grab a bunch of cities, and then the game ends with you having several hundred points.

Now I couldn't be bothered doing this, because I played it so it _would_ be hard. However the Atari version solution is a good one IMHO, it gives the computer some minimum time to make some moves. I also thought the solution in Legionare sounded reasonable (the enemy is _moving_, not just thinking) and there are no real "turns" so to speak. Never played it though, so I can't say how it turned out.

$17 for a complete 800Xl is a very fair price.. the power supply might be tricky to find.. especially if that 800Xl does NOT include a power supply. Yeah there is a version of Wizard of Wor from long time ago for the Atari 8bit, but RPG Towers I dont know.

The Atari ST is a 16 bit machine, 680x0 processor.. has better sound and grafx than the 8bit counterpart, but not as much character! :) <grin>

Program Jag games on the Atari 8bit? Never heard of such a thing, maybe who knows...

Specs, try linking with one of the FAQ that Michael Current posts every month... you can get all the information you need from there..

I just got one for only $3 and it came w/ power supply, 1050
transformer(no drive though) and five carts, some of which I'm going to
trade of. So I would have to say that no $17 is not a good price to pay
if they don't even include a PS.

> I heard some sort of rumor that you can program Atari Jag games
> with one of these. Is this true?

No, you must be thinking of the Jag Server which is a modified Jaguar you
plug into any ST computer and program some code using Devpack assembler.

> Also, does anyone have specs for the system? What is the
> difference between this and the ST?

The only thing those two machines share is the Atari name...they are
completely different as night and day. Can't hurt to own both :)

> Is there a version of Wizard of Wor that will run on this system?
> How about the rpg Towers?

Wizard Of Wor is availible on cart, disk, or cassette. Towers is only for
the ST however.

Oh I say it's a 'very good' system, been using one for about 10 years now.
If you like the ST then you'll love the 8-bit :)

I picked these games up at a thrift store today for only $3(a whole 800XL
came free with it :), but I'm not exactly sure "how" to play these games.

Can anyone offer some tips to get me started or point me to a manual
archive with the game instructions? Thanx...

Yup, he did it to mine, too. Some examples are even worse:

From my archive, a manual, paraphrased by VSP(not the factory manual):

[Note: This is not the original manual, merely a paraphrasing of
what's in it and how to play. If there's anything major I missed,
though,
I'll be rather surprised. --JC]

then the same manual, from Novak's page:

[Ed. Note: This is not the original manual, merely a paraphrasing
of what's in it and how to play. If there's anything major I missed,
though, I'll be rather surprised.]

Notice... he changed the "Note" to "Ed. Note" and removed the initials,
"JC". At the end of this manual, here's mine:

And when you get bored, whack a Minotaur and pick up the chest he leaves
to see the sunshine...

jeff. time required to reach this point varies,
of course.

Anyone who knows VSP's messages, they know that he always has a tagline
that's always different. One of the uniquenesses about Jeff. Now what
Novak has on his page:

Ed. note: time required to reach this point varies, of course.]

Video Game Advantage WWW manual archive --
http://www.io.com/~vga2000

THIS is a flat-out insult to not only me, but especially to Jeff, who
spent the time and energy typing this, BY REQUEST of me. That's right,

nobody seemed to have the manual, and nobody knew how to play it. So kindly, Jeff typed up these instructions for the use of people on the Internet.

It's one thing to take the manual, which is what my archive was designed for. It's another thing to remove all credit and make it seem that Novak, "Editor", has written it.

Tell me, Mike, what happened to all the moralistic drabble you emailed me when I simply linked to your screenshots? I would say this is much worse. I gave credit to you all along the line, whereas you removed all credits in the manuals, and replaced them with a little statement on your archive page, "To all who typed these in, thanks!" Who all typed them in, Mike? I have a list of approximately 30 to 40 people, do you know who they are? Do you even care?

A lot of time(almost 4 years) and effort of not only me but many others has been expressed in putting together my archive, |tsr's archive, and others. To have you simply take them and remove all credits, Mike, that's wrong. I'm embarrassed and ashamed of you.

By all means, run it on the real thing if you want the full experience.
OTOH, Rainbow can indeed run a cart. All you need is the ROM image. I was
able to able to get one from my own cart version using a cart "backup"
program. The "backup" program added some extra stuff at the beginning and
end of the file, but once all that was stripped out, I could "insert" the
ROM image into Rainbow and run it flawlessly. This can be done with any 8k
or 16k cart. Bank-select carts (for instance 48k) are a different matter.

$17 is way too much, even for one in a mint condition. The last three I bought
all costed me less then $10 (I even paid slightly over $1 once :)). And
that's all with PS and a tape recorder.

> I heard some sort of rumor that you can program Atari Jag games
>with one of these. Is this true?

No chance. It's an old 8-bit system from the eighties.

> Also, does anyone have specs for the system? What is the

The Atari ST is the younger (less-older) brother of the 800XL.

> Is there a version of Wizard of Wor that will run on this system?

Yes. Maybe it's even available for download at Yogi's archive.

>How about the rpg Towers?

Dunno about that.

Well, it's quite easy to build a new PS yourself. As for it being a good
system, I'd say yes, but what would you expect in an Atari 8-bit newsgroup. :)

I have to agree with you when it comes to emulating the CPU itself. I have yet to see an emulator that can run EVERY demo and EVERY game with NO futzing around on my part. I doubt I ever will either. 'sides my 130XE and Commodore 1702 monitor (and now a C64 as well....my boss gave it to me....fun machine love that SID chip but it doesn't animate a brilliantly colored and dynamic playfield like my Atari.) take up only a third of my somewhat huge desk. There is no substitute for that. Firmly agreed.

However, I do have to say that the periphreal emulators like SIO2PC and APE are a HUGE improvement over the real thing. No way am I getting nostalgic about stacks of 5 1/4" floppies and that slow mechanical access. Even though my 1050 had a US doubler, it just doesn't compare to the throughput and speed of the SIO2PC cable . The only thing I use a real drive for now is archiving a real disk to a disk image on my PC (a real drive can sit between the Atari and the PC...the PC becomes just anothe drive in the SIO chain). Menu access and instant loading. And I will see a new floppy a maximum of once...when it is copied to the PC. If you haven't tried a disk emulator, I greatly recommend it. It took a fondly remembered good thing and made it GREAT!!

Right. It would be wrong to give out copies of those manuals.
You wouldn't want to do anything eithically questionable, would you,
Mr. Norvick?
I think what he means is, he can't find any collection of
manuals for games on the above mentioned systems to rip off.
Well, if anyone is interested in SNES manuals NOW, you can
find a few on my SNES page http://www.cs.sbu.edu/~cassanit/snesrep/
And, Mr. Norvick, all the manuals there, as of now, are all typed by
ME, and you CAN'T put them on your page.
You can also find Game Boy manuals at
http://nesworld.parodius.com, under the Gameboy Zone page (the link is
at the bottome of the opening page).

>have any game manuals for these systems already typed / scanned
>in, please let me know. I will be happy to accept them now for future
>inclusion in the archive.

I do, and they are going on my page, where I, and anyone else
who types up a manual, will receive proper credit.

>Next, I'll probably finish up the Atari 7800 and Atari 2600 sections.

You can see them now on Greg's page, which is, by the way, a
hell of a lot better than yours.

ATV has been advertising on the newsgroup that they have power supplies
for everything for four bucks. The phone number is 510-352-3787. (And
those connectors weren't considered so strange 15 years ago!)

->> Also, does anyone have specs for the system?

Books and magazines are available by the boatload. For online info,
read this 8-bit newsgroup.

->> I heard some sort of rumor that you can program Atari Jag games
->> with one of these. Is this true?

Do you mean "write" a program? You could do that on any platform, or
on a typewriter, or by longhand. Running the program you've written
(programmed) is another thing.

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SLM 124
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

I have some MFM & RLL Hard Drives I got Directly from the Shadow of
Shadow Software. Older Technology made with a lesser chance of Planned
Obsolescence. Built like Tanks. The Shadow tells me each one worked
before they were taken off their Computers. Each one, $25, as is. Model
numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for
Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST
HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may
find something you've been looking for. Something you might want. Even
Something you may of Forgot! At BSC's Web Site you can View, Capture &
even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request
Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why
not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or
Feel free to Request catalogs through E-Mail. Really, it's no inconven-
ience. All I ask is that you specify Atari 8 Bit, Atari ST or both.
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I
will get back to you after the weekend. Please let me know if I can't
attach files to your E-Mail. Please Direct any and all Replies Through
E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in
Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC
Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow
Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer
Platform. Also from The Shadow of Shadow Software (my Boss) a File

called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

The only game that fits the description is 'Thunderblade', which came
out in the arcades in 1987, and on home computers in '88.

: > >>: There are 857 manuals for the following systems:
: >
: > >here's how mr. novak got these nes manuals:
: >
: Yup, he did it to mine, too. Some examples are even worse:
:
[snip description of snub of Jeff Coleburn]
: THIS is a flat-out insult to not only me, but especially to Jeff, who
: spent the time and energy typing this, BY REQUEST of me. That's right,
: nobody seemed to have the manual, and nobody knew how to play it. So
: kindly, Jeff typed up these instructions for the use of people on the
: Internet.
:
: It's one thing to take the manual, which is what my archive was designed
: for. It's another thing to remove all credit and make it seem that
: Novak, "Editor", has written it.

This is upsetting but certainly not completely out of character for Mike.
Anyone that would take the time to type up what essentially amounts to
bitching rants about other people to put at the *top* of their home page
(at least that's the way it looks in Lynx) certainly seems questionable
to start with. But then we all know Mike from his previous fun fests on
this ng, so his demeanor is well-known. I'm just surprised he let himself
be so easily caught. I always figured him for the type that should he do
something bad, he'd then obsess about being caught so bad that he'd either
(a) remove all trace of the offending thing (in this case remove the manuals)
or (b) work up some slick disclaimer to cover his butt (like ``these will
never be auctioned on the net'', re: FBE packs).

: Tell me, Mike, what happened to all the moralistic drabble you emailed
: me when I simply linked to your screenshots? I would say this is much
: worse. I gave credit to you all along the line, whereas you removed all
: credits in the manuals, and replaced them with a little statement on
: your archive page, "To all who typed these in, thanks!" Who all typed
: them in, Mike? I have a list of approximately 30 to 40 people, do you

: know who they are? Do you even care?

Most likely not. Mike seems (at least by his posts) to be in his own
world and I would doubt it if he really cared about the folks that typed
them in. The fact that he didn't let you know that he was taking them
and the fact that they were modified from their original form is enough
for me to conclude that he most certainly didn't care whose they were
or whether credit should be given for the work that went into them.

I'd be surprised if he responds to this, really. I mean he has done things
before where he was flat out wrong and then never followed up on them. For
example, just ask Reinhard Pribish about the time Mike called him a liar
on the ng and then when challenged to do so, Mike never produced and example
of where Mr. Pribish had done so.

Of course, if he does reply, it'll be fun to read his reply.

Sorry folks I still have not set up the Atari so I can dig up my emacs-subset editor for the XEP-80.

I had planned to do it last weekend. This weekend FOR SURE!! :-)

I'm pretty sure I can get the util program to copy to IBM then to the Sun network at work to post it... I think I still have a 286 with a 5" drive at home somewhere... but is posting binaries to this group kosher?

If someone has a better method, would you be willing to be mailed an Atari floppy and take it the rest of the way? It would be OK with me if it got posted or webbed somewhere. Sources and doc included, of course.

If bugs get reported I'm not sure if I'll be able to fix them, but I'll try.

There may be some interesting information within the Library of
Congress concerning copyright infringement.

Check out the following URL:

http://lcweb.loc.gov/copyright/circs/circ01.html#hsc

I haven't read the whole thing yet, and I don't pretend to understand
everything I'm reading, but someone out there should be able to sum up
what this means in terms of keeping Atari software alive through the
internet.

Thanks Fernando, I was beginning to think no one was listening.

I personally do not care what the package is called, and it would be
very easy to remove all references to Gardner Computing and the
Pirates Treasure Chest. My intention was to help an end-user who was
having trouble copying a damaged disk, and the sector copier on the
PTC can do just that. According to your statement, I should be able
to give him that particular program with no problems.

I posted this elsewhere, but I think it's relevant here also:

This is the URL for the Library of Congress' definition of copyrighted
material.
http://lcweb.loc.gov/copyright/circs/circ01.html#hsc

Thanks again,
Steven

> Dave M.

Dave, I wish I could go along with you on both of those products. If,
as you do, someone wanted to just eliminate the 1050s, both A. P. E. and
SIO2PC would work just fine. But I'm in a position of having to
duplicate between 35 and 40 floppies (double-sided, single density)
every two months. For me, SIO2PC does the job, but because of some
quirk or other in my setup, I can't get A. P. E. to help in this job.
It seems to fall down when communicating betweeen disk images and real
floppy drives. And, yes, Steven Tucker and I have been around this
problem many times and he's tried to help as much as he can.

Do you, or any one else, know if a Quintopus does any buffering?

>problems I'll run into.

Umm, look for a switchable OS mod. Then use the Antic chip select line instead of the ROM select line. Voila. Switchable Antic. Only problem I foresee is this:

The Nir-PAL upgrade also uses a switchable OS; you're starting to get a lot of switches on your system, and there isn't a whole lot of free real estate inside an xl/xe.

1026. 8-bit Catalogues reminder

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-08 00:00:00 UTC
From: DGS <dgs@clara.net>
Message-ID: <5sg0ou$d68$1@eros.clara.net>
Source record: 71047

Just wanted to remind everyone that our Atari 8-bit product catalogues are now available on-line from our WWW homepage.

Thanks to all 50 people who have so far visited our page.

In case you don't know, we sell PD and Commercial software for the Atari 8-bit, along with a variety of used hardware, software and magazines.

We have English language distribution rights to all Power Per Post products, including the QUICK programming language and Screen Aided Management 80 col. desktop system.

Our 26 page catalogue lists all 190 PD disks and details all our Commercial software.

The list of used items is also available on the WWW site.

The catalogues are available as individual text files, or as a combined .ZIP file for easier downloading.

We can ship to any country, and can accept payment in US$. See the catalogues for full details.

If you haven't visited our WWW page then please have a look now! We might have something you want!!

Screenshots are screenshots, Mike. I gave a quick credit as to who they
were by until I was able to write the CGI scripts that I currently run.
If you notice, all of Jeff Coleburn's screenshots have his name on them.
Yours would have been the same, *if* you hadn't pulled what you pulled.

Your ORIGINAL (copyrighted) screenshots belong to the respective
companies. There was nothing wrong with linking to them--how was I
stealing your Internet service by doing this? I'm unclear about this.
The files still remained on your server. The user linked to your server
in order to access them. I did not access them, the users did. How was
I stealing it?

Stealing would have been downloading the screenshots, putting them on my
own page, with a generic note stating, "To whoever scanned these
screenshots, thanks!"

> As for Jeff, he may be mad at me (I don't know), but we've always had
> pleasant e-mail conversations in the past. If he has a problem,

>
No, you did not claim to be the editor. However, was a credit listed
anywhere as to who the editor was? If you don't specify this, it's
implied
that *YOU* are the editor, being the webmaster.

> I did NOT remove all credit. Where there was proper credit to the
> game company (copyright holder) it was left it.
>
You know damn well when I refer to all credit I refer to typing credit.
Of
course you left the original game company copyrights there. You were
too
afraid to put your own name in their places.

> >Tell me, Mike, what happened to all the moralistic drabble you emailed

> site and you also stole, YES STOLE, service. I, NOT YOU, pay for my
> web site at io.com. To everyone it looked like you had done the
> screen shots.
>
You don't understand how web space operates. Stealing service would
have
been to log onto your account, change the password, and put my own pages
in their place. Linking to something that already exists on the web is
not stealing.

> You did not give me PROPER credit. Putting "Michael J. Novak's
> screenshots" in an obscure file is NOT proper.
>
> I would say that what you did was MUCH worse.
>
So when Internet World printed the URL for the ROMs page on my server
without listing my name, that's different?

> Again, I left all PROPER credits. The companies (not the typers) own
> the copyrights, and where it was present, that information was left
> in.
>

So you're saying that in the case of Atari 5200 Star Raiders or Atari
2600 BASIC Programming, that spending 3-4 hours typing them did not
warrant having a name listed? I think it's a great service to do typing
for the cause.

> Yes, I did place a general thank you at the beginning of the manual
> archive. I did so because I appreciate the work they did.
>
You appreciate the work they did so much that you didn't name names.

> Did you care that I put all of that time and energy into the game
> screen shots?
>
Yes I did, actually. I was quite impressed at the time you spent
creating
screenshots, this is why I was avoiding duplication of effort. If you
did
such a good job, why duplicate? This isn't a competition here, it
should
be a cooperation to give users the best reference available.

> >A lot of time(almost 4 years) and effort of not only me but many others

> >Greg Chance
> >Creator/Maintainer/Webmaster
> game screen shot thief
>
Ground already covered.

> copyright violator
>
You've just done the same, my friend.

> software pirate
>
The people who download the ROMs already own the cartridges. As long
as the don't play the ROM and the cartridge at the same time, it's not
piracy, it's backups.

> stealer of Internet service
>
Have you asked your ISP if what I did was stealing Internet service?

> hypocrite
>
Yup.

> ONE MORE TIME, I did NOT remove all credits. Credit to the copyright
> holder, if present, was left in. The real question is why was this

> information not present in all of the files BEFORE I edited them?
>
Because not all of the manuals have copyright information. In fact, tbe manual for Challenge is nothing more than a photocopied piece of paper. I noticed you didn't give the copyright information for this manual either.

> You sure weren't spewing this "moralistic drabble" when you STOLE my
> copyright work! You have a LOT of nerve!
>
You're right, Michael, I have a lot of nerve. How dare I be on the Internet long before you. How dare I buy a scanner to make what is presented to the online community better. How dare I care about giving credit to the people who worked hard typing in instruction manuals for my archive. How dare I not want that credit removed. How dare I see you take their original work--that's right, the method of ASCII art is their original work, their notes embedded in the manuals is their original work.

And as far as typing credit missing from some manuals, those are in my "thanks" page, which you seem to forget about. I admit that early on, there was such an influx of manuals coming in that at times I was shoddy with my records. That's what happens when you have 50 different people submitting 1200 manuals to one person. You sort of take short-cuts.

Yawn, I'm going to bed.

Dear Citizens,

I'm here to tell you of a great oppurtunity to truly gain your independence and be part of a team that will make you the best at what you do. What team am I talking about? Well of course the Starship Troopers: Mobile Infantry. The best military force on and off Earth. If you are interested in joining up (which you should, it's a great site and gives away great prizes) just go to http://www.starshiptroopers.com and go to enlist,to sign up. Once there put DAWSON as your recruiter and you'll be in. It's great to join and there are others on the MI that will help you if you get into trouble. And also, join my Platoon (Division 1/ Regiment 2/ Platoon 2) because we are the best. So are you interested at this offer? Service guarantees Citizenship!

Mobile Infantry: They've got the guns! They've got the ships! They need you!

I have to agree with you when it comes to emulating the CPU itself. I have yet to see an emulator that can run EVERY demo and EVERY game with NO futzing around on my part. I doubt I ever will either. 'sides my 130XE and Commodore 1702 monitor (and now a C64 as well....my boss gave it to me....fun machine love that SID chip but it doesn't animate a brilliantly colored and dynamic playfield like my Atari.) take up only a third of my somewhat huge desk. There is no substitute for that. Firmly agreed.

However, I do have to say that the periphreal emulators like SIO2PC and APE are a HUGE improvement over the real thing. No way am I getting nostalgic about stacks of 5 1/4" floppies and that slow mechanical access. Even though my 1050 had a US doubler, it just doesn't compare to the throughput and speed of the SIO2PC cable . The only thing I use a real drive for now is archiving a real disk to a disk image on my PC (a real drive can sit between the Atari and the PC...the PC becomes just anothe drive in the SIO chain). Menu access and instant loading. And I will see a new floppy a maximum of once...when it is copied to the PC. If you haven't tried a disk emulator, I greatly recommend it. It took a fondly remembered good thing and made it GREAT!!

I have the following items for sale:

Atari 1050 disk drive, non-working, for parts only. No power supply. $5

Atari XL/XE power supply. I haven't tested this one so I don't know
if it works. $3

Epson LX-86 printer, 9-pin dotmatrix. Works and looks great. Includes
Apeface parallel interface for Atari. $22

Okidata Microline 182 printer, 9-pin dotmatrix. $10

Multitech 1200 bps external RS232 modem. With power supply. $5

Software:

Paperclip 1.2, with manual and copy-protection key. $8

SynFile+, with box, manual and refenence card. $5

F-15 Strike Eagle, with box and manual. $4

Silent Service, with box and manual. $4

Choplifter, disk only. $3

Bank St. Writer, disk only. $3 (I have two of these.)

Letterperfect (400/800), with xeroxed manual. $4

B/Graph, with xeroxed manual. $4

10 Compute Magazine disks. These disks contain all of the
Atari type-in programs in Compute magazine from January '86
to April '88. All ten disks in a plastic case, $8

Flight Simulator II cart. Part of label is missing. $5

Atari BASIC Revision A cart. With manual. $4

Inside Atari BASIC, book. $4

Print Shop, with box and manual. $7

Print Shop Companion, with box and manual. $7 (I have two of these.)

Print Shop Graphics Disk #1. $3 (I have two of these)

Print Shop Graphics Disk #2. $3

Print Shop Graphics Disk #3. $3

Note: the above three grfx. disks include reference cards.

Christian Scenes and Symbols. Graphics disk for Print Shop. $3

Math Blaster, educational game for Atari and Commodore. 2 disks. $3

These prices do not include shipping. I am in Dayton, Ohio.
If you don't like my prices please make an offer.

I also have some Commodore, IBM, and Apple][items for sale,
if anyone is interested.

Yeah, there is something. I used to use it on my 130XE but it works on the 800 as well. By an outfit called Synapse. There's SynFile, a template kit for SynFile, SynChron (calendar) and SynCalc (spreadsheet). i used to use them a lot ...

>and put them on his page.

1) I downloaded them from several different locations, over a 1-2 year
period of time.

2) I did NOT remove any company credits (they are, after all, the
copyright holders). I also plan on adding this information to the
files that are missing it, as soon as I can.

3) I added a general "thank you" at the front of the manual archive
section.

4) I "cleaned up" all of the files (some more than others). This
involved removing all non-relevant information.

5) I added a note at the end stating where the file was located.
My site seems to attract a lot of people who simply put up links
directly to my files (I'll mention Greg Chance here, since he also
posted a reply to my announcement message, although I will say he
isn't the only offender, just the worst). I'm paying for the storage,
hence the tag line.

I corrected some spelling errors, but no, I did NOT proof-read every
line of every file.

I'm a little surprised that you'd bring this up. After all, if I knew
of a misspelled word (as you apparently did) I would have corrected it
by now. :)

>you'll also see how michael

>
>-tsr

Kev, I'm glad to hear that you don't mind. I'll tell you what...I'm
buying a scanner VERY soon, and when I begin scanning in/editing files
that NOBODY has on-line right now (I have almost 600 NES games), and
placing them on my web site, you can take them. Do you know why? I
don't hold the copyright on them. And if you want to include credit
lines in the files on your system, thats fine. Its not that I don't
appreciate the work involved, because I do.

After doing almost 1700 ORIGINAL game screen shots (if you knew how
long it took sometimes to get a single *decent* screen shot, you'd
honestly wonder how I did that many), there is nothing like logging
onto someone else's system and seeing links directly to your files,
with no credit given, and no permission asked. You see, I do own the
copyrights to the actual screen shots, although I make no claim to the
rights to the characters or actual game (open any video game magazine,
and you'll find that they operate the same way). And by the way,
everyone who has asked me has been granted permission.

Another example for you: say I'm walking near the Lincoln Memorial,
and I see Bill Clinton tripping down the stairs, and I take a quick
picture. Can I sell it? Well, I don't own Bill Clinton, and I don't
own the Lincoln Memorial (at least not any more than the average U.S.
citizen), but I do own the picture, and I can sell it to whomever I
like. Why? Because its my original work.

Simply typing in, or scanning/editing a manual doesn't afford you any copyright claim. And since it doesn't, and the most important thing is getting the manuals into the hands of those who need them, don't you think that this is a pretty silly thing to get upset about?

As for Greg Chance, at least I didn't pull a "Greg Chance" and link directly to the files on his site.

Thats a bit of a reach. You haven't been visited by MIBs lately, have you?

"Hard work" and copyright-able material are two different things.

Where were you when Greg Chance linked directly to my ORIGINAL (copyrighted) game screen shots, hmm? THAT was very sly and very underhanded!

>Oh yeah, the line:

All company information was left in the manuals (provided it was present in the first place). The files without it will have it, as soon as I have the time.

As such, it should have been obvious to anyone that I was not claiming ownership of the game manuals. The above notice was not meant to be taken the way that you have taken it. I have clarified it, for those like you who may be confused.

Not to mention the fact that when you re-printed my copyright notice (above) you violated my copyright! Now thats humorous and incriminating :)

No, I'll tell you what is a flat-out insult to someone who spent time
and energy. Last year you set up unauthorized links to most of my
ORIGINAL (copyrighted) game screen shots. Then you got upset when I
changed the files on my system to ads for my web site. You sure
didn't seem to care about insults and time/energy last year Greg!

As for Jeff, he may be mad at me (I don't know), but we've always had
pleasant e-mail conversations in the past. If he has a problem,
hopefully he'll e-mail it.

As for the Intellivision AD&D: Treasure of Tarmin manual, I have it,
and I'll be scanning it in as soon as I buy my scanner (soon), along
with MANY other manuals that nobody has done before.

>It's one thing to take the manual, which is what my archive was designed
>for. It's another thing to remove all credit and make it seem that
>Novak, "Editor", has written it.

I NEVER claimed to be the editor, or to have typed in any of the
manuals. I did take two different versions of Atari 2600 Frogger and
make them one (nicer) manual. Other than that, I just cleaned the
files up.

I did NOT remove all credit. Where there was proper credit to the
game company (copyright holder) it was left it.

>Tell me, Mike, what happened to all the moralistic drabble you emailed
>me when I simply linked to your screenshots? I would say this is much
>worse. I gave credit to you all along the line, whereas you removed all

>your archive page, "To all who typed these in, thanks!" Who all typed
>them in, Mike? I have a list of approximately 30 to 40 people, do you
>know who they are? Do you even care?

Greg, you did not "simply link" to my screen shots. You not only
violated my copyrights, but you didn't give me credit or a link to my
site and you also stole, YES STOLE, service. I, NOT YOU, pay for my
web site at io.com. To everyone it looked like you had done the
screen shots.

You did not give me PROPER credit. Putting "Michael J. Novak's
screenshots" in an obscure file is NOT proper.

I would say that what you did was MUCH worse.

Again, I left all PROPER credits. The companies (not the typers) own
the copyrights, and where it was present, that information was left
in.

Yes, I did place a general thank you at the beginning of the manual
archive. I did so because I appreciate the work they did.

Did you care that I put all of that time and energy into the game
screen shots?

>A lot of time(almost 4 years) and effort of not only me but many others
>has been expressed in putting together my archive, |tsr's archive, and
>others. To have you simply take them and remove all credits, Mike,

>
>Dr. Demento
>Greg Chance
>Creator/Maintainer/Webmaster
game screen shot thief
copyright violator
software pirate
stealer of Internet service
hypocrite
>The History of Home Video Games Homepage

Greg, I added the five lines that you left out of your sig.

ONE MORE TIME, I did NOT remove all credits. Credit to the copyright
holder, if present, was left in. The real question is why was this
information not present in all of the files BEFORE I edited them?

You sure weren't spewing this "moralistic drabble" when you STOLE my
copyright work! You have a LOT of nerve!

No, I wouldn't want to do anything illegal, Mr. Classytiti. That is
why I left in the copyright information, where it was present.

> I think what he means is, he can't find any collection of
>manuals for games on the above mentioned systems to rip off.

No, what I mean is that those systems are still supported, which
strangely enough is just what I said. Words mean things!

> Well, if anyone is interested in SNES manuals NOW, you can
>find a few on my SNES page http://www.cs.sbu.edu/~cassanit/snesrep/

The funny thing is, you don't have a link to this page from your main
page. Could it be that you realize that you are doing something
illegal? What would Nintendo think? Heck, what would RL think!

>And, Mr. Norvick, all the manuals there, as of now, are all typed by
>ME, and you CAN'T put them on your page.

Well, Mr. Classytiti, I wouldn't bet against me, if I were you.

Thanks for the tip. The day that the big N announces that the SNES is
dead, they go on-line (along with all the manuals I'll be scanning
from my collection, soon). Bet on it!

> You can also find Game Boy manuals at
>http://nesworld.parodius.com, under the Gameboy Zone page (the link is
>at the bottome of the opening page).

Thanks for this tip too! Ditto the above statements (subbing GB for
SNES).

>>in, please let me know. I will be happy to accept them now for future
>>inclusion in the archive.

>
> I do, and they are going on my page, where I, and anyone else
>who types up a manual, will receive proper credit.

Just make sure you leave the copyright information in. I dare say the
game companies will find that more important than who typed it in,
should they discover your sight.

>>Next, I'll probably finish up the Atari 7800 and Atari 2600 sections.
>
> You can see them now on Greg's page, which is, by the way, a
>hell of a lot better than yours.
>
> -FM2000

That line, dolt, refers to my game screen shot section (just as it did
in my 05/07/97 announcement -- go to Dejanews and look it up), and
unless Greg has put up MORE unauthorized, copyright violating links,
I'd say you are wrong. Thanks for stopping by anyway!

Personally, I'd like to see how many hits Greg's page would get if you
pulled all of the illegal ROM images. Then again, that won't happen
because violating copyrights is Greg's thing. He is soooo good at it.

Michael
(as to why I haven't done the 2600/7800 screen shots I promised in May
-- I got everything set up and for whatever reason they weren't coming
out right, so after trying for awhile, I gave up and put everything
away again. I'll try again, soon.)

John. Anyone that would take the time to type up what essentially
amounts to bitching rants about other people to put on RGVC (at least

thats the way it looks in Agent) certainly seems questionable
to start with. But then we all know John from his previous fun fests
on this newsgroup, so his demeanor is well-known. I'm just surprised
he let himself be so easily caught. I always figured him for the type
that should he do something bad, well, lets face it, he can't stop
doing things like this, so it must not bother him. Otherwise, he'd
either (a) remove all trace of the offending thing (in this case
remove the post) or (b) work up some slick disclaimer to cover his
butt (like ``Help me! I can't stop myself!", re: repeated lies and
attack, including but not limited to FBE).

>: Tell me, Mike, what happened to all the moralistic drabble you emailed

>for me to conclude that he most certainly didn't care whose they were
>or whether credit should be given for the work that went into them.

Most likely not. John seems (at least by his posts) to be in his own
world and I would doubt it if he really cared about the folks that
he attacks and lies about. The fact that he doesn't stop doing it is
enough for me to conclude that he most certainly didn't care not only
what doing it makes him look like, much less about the people that he
does it to. At least he takes credit for the work that went into the
messages.

>I'd be surprised if he responds to this, really. I mean he has done things

>of where Mr. Pribish had done so.
>
>Of course, if he does reply, it'll be fun to read his reply.
>
>matt

I won't be surprised if he responds to this, really. I mean he has
done things before where he was flat out wrong and then he always
followed up on them, which only made him look worse. For
example, remember when he and WRB tried to play a bait-and-switch with
the truth back in '95. They challenged me to prove them wrong, and I
did so. They still haven't admitted they were wrong.

Michael
(as for Whiny Reinie, I never say those posts. He knows damn well
what he lied about, and you do too!)

Now, here is a blast from the past (approximately 11/08/95):

I hope that despite the size of this post, that some of you will take
the time to read this. It concerns the lies that two people (WRB and
JVM) have been spreading about me, and the proof (which I found by
accident yesterday) that they are indeed the true liar and hypocrite
(respectively).

If you are interested in the truth, please read on.

The two people in question are:

WRB William Ruffin Bailey wrbailey@unity.ncsu.edu
JVM John Vivian Matthews jvmatthe@unity.ncsu.edu

WRB has accused me of lying about sending him e-mail (that I did not
send him), and JVM has posted his support for WRB and also accused
me of hypocrisy, and the crime of posting e-mail that was sent to me
(ouch)!

To make sure that everyone knows who said what, any text that is
quoted from a Usenet post will begin with the initials of the person
who posted the message (my new text for this post will not). E-mail
is labeled as such, and is arranged in the order that it was sent.

It all started when WRB posted a message, that I replied to:

Newsgroups: rec.games.video.classic
Subject: Re: IN DEFENSE of MIKE NOVAK [gasp]
From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Date: 30 Oct 1995 10:47:36 GMT

MJN> In <4713ua$73e@taco.cc.ncsu.edu> wrbailey@unity.ncsu.edu (William
MJN> Ruffin Bailey) writes:

WRB> Just as an added note, in my one corespondence with Old Man
Novak,
WRB> the response I got was curt and generally rude. And all I did
was
WRB> say that if he had any Pac-Man carts left over after his sale
that
WRB> _didn't_ sell, I would be willing to buy the whole lot (TG P-M's,
WRB> that is) (admittedly for a good deal less than he was asking, but
WRB> I won't get into that now).

MJN> Well Old Man Bailey, I found the e-mail of which you speak, and
MJN> I don't think that I was "curt and generally rude", but everyone
MJN> can judge for themselves. Here is the message that I sent in
MJN> response to your e-mail, with your entire message quoted at the
MJN> beginning:

At this point, I have deleted the quote of his e-mail from my post, in order to insert the entire 3 message e-mail conversation. I would also like to point out that WRB and myself had had TWO e-mail conversations, not one as he claimed. Here is the first one:

E-MAIL From: wrbailey@unity.ncsu.edu
Date: Tue, 26 Sep 1995 14:30:21 -0400
To: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: FS/T: Classic games & systems -- MASSIVE SALE [95-15]

What's with a Sears Pac-Man at $5? What's so special about it?

Ruffin Bailey

E-MAIL From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: FS/T: Classic games & systems -- MASSIVE SALE [95-15]
To: wrbailey@unity.ncsu.edu

You wrote:

[QUOTE OF WRB's PREVIOUS E-MAIL MESSAGE DELETED -- MJN]

The game itself is no different than Atari Pac-Man. However, the Sears version wasn't as widely sold (since it was available only at Sears, while the Atari version was available anywhere Atari games were sold, except Sears). Thats the reason that the Digital Press Classic Videogames Collector's Guide lists it at $10. I obviously don't agree with that price, which is why I set mine at 50% of their "guide" price.

If you aren't interested in it, nobody is forcing you to buy it, but there are people who want a complete 2600 game collection. The Sears label Pac-Man game is much harder to find than an Atari label version. I would say that I find at least 35 Atari labels for every 1 Sears.

If you would like, I can send you the DP info/address.

Take care,

Michael

We now briefly rejoin my response to WRB's usenet post:

MJN> *****
MJN>
MJN> I'm back :)
MJN>
MJN> I believe that I explained the reason to you, and without being
MJN> as you say "curt and generally rude". Here is your response:

Now, back to the e-mail conversation:

E-MAIL From: wrbailey@unity.ncsu.edu
Subject: Re: FS/T: Classic games & systems -- MASSIVE SALE [95-15]
To: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Date: Wed, 27 Sep 1995 13:24:20 -0400 (EDT)

> You wrote:

[QUOTE OF WRB's INITIAL E-MAIL MESSAGE DELETED -- MJN]

> there are people who want a complete 2600 game collection. The Sears
> label Pac-Man game is much harder to find than an Atari label version.
> I would say that I find at least 35 Atari labels for every 1 Sears.

I've got at about nine tele-games outta my 130 Pac-Man carts right
now,
so I do agree that they're harder to find, I was just noticing that $5
is
way over the current going rate in auctions of about $1.50. I was
wondering if it was still in the shrinkwrap, which would be more of a
find. If nobody bids the $5, though I reckon somebody might, I'll buy
it
for $1.50 if you want to go that low; of course I realize that "nobody
is
forcing you to..." sell it! %^)

Ruffin Bailey

We now rejoin my response to WRB's usenet post:

MJN> *****
MJN>
MJN> I'm back again :)
MJN>
MJN> I did not respond to this message. I agree that since you quoted
MJN> back only the middle of the message, it does sound a little
harsh,
MJN> but ONLY because you did it that way!
MJN>
MJN> I hardly think that if I was trying to be "curt and generally
MJN> rude", that I would have taken the time to both explain my
pricing,
MJN> and offer to send you the DP information (let alone end the
message
MJN> "Take care")!
MJN>
MJN> And if I was "curt and generally rude" to you, Old Man Bailey,
why
MJN> did you send me e-mail, not two weeks later, asking to buy
something
MJN> from me? You didn't end up buying the item, but according to you
MJN> the reason was NOT that I was "curt and generally rude".

Here is the second e-mail conversation that we had about two weeks
later:

E-MAIL From: wrbailey@unity.ncsu.edu
Date: Mon, 9 Oct 1995 19:40:33 -0400
To: vga2000@ix.netcom.com (Michael J. Novak Jr.)

Subject: Re: FS/T: Atari 7800 games and system

I am sorry to bother you with this, since I'm not sure I want to
buy, but could you tell me how much the 7800 system would cost to
send it to Raleigh, NC? Thank you.

Ruffin Bailey

E-MAIL From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: FS/T: Atari 7800 games and system
To: wrbailey@unity.ncsu.edu

You wrote:

[QUOTE OF WRB's PREVIOUS MESSAGE DELETED -- MJN]

If you will please send me your mailing address, I will be happy
to send a copy of the shipping information, including the cost of
postage.

You can decide at that time if you would like to purchase the system.

Thanks,

Michael

E-MAIL From: wrbailey@unity.ncsu.edu

To: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: shipping

[QUOTE OF SHIPPING INFORMATION MESSAGE THAT I SENT DELETED -- MJN]

I do apologize. I have just gotten a hint from a friend that I might just be getting a 7800 for Xmas from him :) , so I am afraid that I must (as I hinted at earlier) decline your offer.

Thanks again,

Ruffin Bailey

Please note that I did not reply to this message.

Again, we now briefly rejoin my response to WRB's usenet post:

WRB> This, naturally, has biased me somewhat, but I do believe that
WRB> this guy is, in general, discourtieous (hello, I'm no speller).

MJN> I am sorry to hear that, especially since there is no reason
MJN> for it. I assure you that your post has done nothing to endear
MJN> you to me!

In part, here is how WRB responded to my post:

Newsgroups: rec.games.video.classic
Subject: Re: IN DEFENSE of MIKE NOVAK [gasp]
From: wrbailey@unity.ncsu.edu (William Ruffin Bailey)
Date: 30 Oct 1995 22:20:39 GMT

: Well Old Man Bailey, I found the e-mail of which you speak,
: and I don't

WRB> No sir, I don't believe that you did. Thats okay, though, I
WRB> don't care.

: I believe that I explained the reason to you, and without
: being as you say "curt and generally rude".

WRB> Very well, in this email you were, no doubt, very helpful and
WRB> basicly a saint. No sarcasm. Well, not much.

I don't think that if I had actually sent WRB a "curt and generally rude" reply at the end of our first e-mail conversation, that we would have had the second one.

Anyway, here is the proof that I didn't send WRB the e-mail that he claims I did (which makes WRB a liar, since he insists that I did). This will also prove that JVM (who has been posting messages of support for WRB), and not myself, is the true hypocrite in this discussion.

Well, between the two e-mail conversations that I had with WRB, I had this one with JVM (which I just accidently found):

E-MAIL From: John Vivian Matthews <jvmatthe@eos.ncsu.edu>
Date: Mon, 02 Oct 95 16:49:08 -0400
To: vga2000@ix.netcom.com
Subject: From your want list...

I have The Heist in box with original instructions. Used, but like new. See my post on the rec.games.video.classic for others.

I am asking $15 or fair trade for it? Wanna talk about it?

matt

E-MAIL From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: From your want list...
To: John Vivian Matthews <jvmatthe@eos.ncsu.edu>

You wrote:

[QUOTE OF JVM's PREVIOUS MESSAGE DELETED -- MJN]

I am interested in discussing a trade for any games that are on my want list. I use straight DP guide prices for trades. In the case of The Heist (Colecovision), with box and manual, that is $12. I am willing to trade $12 worth of games from my FS/T lists (again straight DP guide price), in exchange for it.

If you want to, you can send me your complete list of items FS/T.

Take care,

Michael

E-MAIL From: jvmatthe@pams.ncsu.edu
Subject: Re: From your want list...
To: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Date: Tue, 3 Oct 1995 12:20:13 -0400 (EDT)

You tell me it is worth $12 according to DP so, how about this from your 2600 list:

Loose cartridges, no box or manual:
$ 2.50 CENTIPEDE
$ 4.00 CODEBREAKER [K]

Cartridges with manual:
$ 2.50 VIDEO PINBALL

Cartridges box and manual:
$ 5.00 DEFENDER II

And I stick $2 in the package when I send you The Heist? Is that ok?

matt

E-MAIL From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: From your want list...
To: jvmatthe@pams.ncsu.edu

You wrote:

[QUOTE OF JVM's PREVIOUS MESSAGE DELETED -- MJN]

You obviously didn't understand what I said. The prices that I sell my games at are approximately 50% of DP guide. The games you quoted above, according to the DP guide, are $5, $8, $3, and $10. I do not sell at full DP, but I do use it as a "guide" for trades.

You can't expect someone to pay you full price for your game, while you pay them 50% for theirs.

I no longer have the copy of Defender II with box and manual. I do have a *NEW*, shrinkwrapped copy, which the DP guide would list at $10+. If you want to, I will trade that straight up for your opened The Heist with box and manual). I will pay to mail the game to you, and you can pay to mail TH to me.

If not, no big deal.

Michael

E-MAIL From: jvmatthe@pams.ncsu.edu
Subject: Re: From your want list...
To: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Date: Tue, 3 Oct 1995 12:57:43 -0400 (EDT)

Michael:

> You obviously didn't understand what I said.

And you obviously assumed that I have a DP. No such luck. :-)

No need to be curt. I am too much the neophyte to be a shyster, so treat me not as though I were one. Your patience would be appreciated.
I would RTFM, but I haven't got one.

> The prices that I sell my
> games at are approximately 50% of DP guide. The games you quoted
> above, according to the DP guide, are $5, $8, $3, and $10. I do
> not sell at full DP, but I do use it as a "guide" for trades.

See above.

> You can't expect someone to pay you full price for your game,
> while you pay them 50% for theirs.

Agreed. Certainly not. But see above.

> If not, no big deal.

Ditto.

However, in light of this knowledge, let me change my request...
(this time, 7800)

Loose cartridges, no box or manual:
$ 3.00 BALLBLAZER
$ 3.00 KARATEKA

So if I have this right, $12 is the worth of my game. However, the prices listed in your sale are 1/2 DP worth. So I should compare 1/2 my DP worth to the prices listed on your pages, and POOF! we have a deal? Is that right? If not, then please don't snap at me again. I really am not trying to be dense.

matt

E-MAIL From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: From your want list...
To: jvmatthe@pams.ncsu.edu

I didn't "snap" at you, and I was not "curt". I also made no assumption that you had a DP guide. I also never called you a shyster, nor assumed that you were. In addition, I never made any assumptions concerning your level of intelligence.

At this point, due totally to your attitude, I am not interested in making any type of deal with you.

Have a nice day.

Michael

E-MAIL From: jvmatthe@pams.ncsu.edu

Michael:

[QUOTE OF MY PREVIOUS E-MAIL DELETED -- MJN]

Wow. I really am sorry that I hit you wrong. I think that we are probably victim to something that I have experienced before: a lack of emotion communicated over textual material. I assure you that my attitude was merely meant as nothing more than playful if I seemed flippant. It seems however, that I have been misconstrued, which is perhaps my fault.

I really didn't mean to upset you, and I must say that now I feel pretty upset myself. In fact, when a misuderstanding like this occurs, I get sort of sick to my stomach. Ugh.

Anyway, I would like to apologize, and if we could somehow make amends, I really would like to. I hope that you will respond so that we may sort this out.

> Have a nice day.

And I do hope you have the same. Sorry if I ruined it...

matt

E-MAIL From: vga2000@ix.netcom.com (Michael J. Novak Jr.)
Subject: Re: From your want list...
To: jvmatthe@pams.ncsu.edu

I accept your apology.

Michael

Now, if you have read this whole message, you will have noticed
three things:

1) JVM, and not WRB, referred to one of my messages as "curt",
which makes William Ruffin Bailey a liar. Also, JVM ended
up apologizing to me for mistaking my intentions.

2) JVM let WRB read private e-mail that I had sent to him, and
since he said that it was wrong for me to post WRB's e-mail
to prove that he was lying about me, and he lets others read
his e-mail, that makes him a hypocrite.

3) WRB is also a hypocrite, since he also said that I should not
have posted his e-mail to me, yet he reads other peoples e-mail.

I apologize for having to post this, but it was necessary.

>Thats a bit of a reach. You haven't been visited by MIBs lately, have >you?

What does this have to do with anything?

>"Hard work" and copyright-able material are two different things.

You are quite correct.

The game companies that orignally published these manuals hold the copyrights, assuming that the said copyrights have not lapsed, or the companies gone out of business.

The people that took the time to take those manuals and type them are where the "hard work" come from., These people are in no way credible for the contents of the manuals and they themselves can claim no part of the copyright. The can and do, however, claim credit for the work that was placed into presenting those manuals in digital form, which you have shamefully and heartlessly removed and denied them.

>Where were you when Greg Chance linked directly to my ORIGINAL >(copyrighted) game screen shots, hmm? THAT was very sly and very >underhanded!

Greg Chance as I recally did not mirror your website michael. In no case did he make local copies of your files. They were links only. You seem to have a distorted sense of reality, as Greg also mailed you for permission, for which you replied that you could not stop him from linking to your screen shots. That's quite remote from saying, "No, please don't link to my shots."

In any case, I am sure that the other regulars of this newsgroup will also concur with me in my view that linking to objects present on a website is one thing. Making a local copy is quite different. More so in the case where permission is asked in one case, and not in another.

I mean, think about it Mike! Had you ASKED? Sheesh, a simple email saying, "I would like to mirror so-and-so on my site, would you mind?" would have been all it would have taken on your part. Though a large number of members of the gaming community

view you with some degree of contempt, even in this case I am
sure that they would have allowed it. Alas, you did not take this
course of action.

>
> I've heard from others that Gardner Computing created the
Pirates'
> Treasure Chest out of public domain software, some of
which were
> type-in programs from Compute magazine. Therefore, I
can't see any
> reason for these programs to remain under someone's
copyright control.

Let me try to clear up some mis-understanding on this
matter...

The programs making up the Pirates Treasure Chest were
written either by myself, or some of the other programmers
who worked for Shadow Software at the time. They were never
released into PD, and if they appeared in any magazines, it
was not by permission of the copyright owner, me.

A distribution Copyright has nothing to do with distribution
rights, as far as the Copyright owner is concerned, only
that no-one else can sell or distribute it. Sometimes this
is called a public copyright by distribution, which means
simply that you are notifying the public of your copyright
in each copy distributed. This type of copyright is
completely valid, and enforceable but is not necessarily
also registered with the library of congress. You have to
remember that when we started writing this stuff, there were
no copyrights specific to computer software, so most of us
used the publishers/distribution copyright. We licensed
Pirates Treasure Chest to others to sell, and in turn they
put their copyright notices in it to cover their menu's etc.

You can't take some-one elses work, and place your copyright
notice in it and call it yours, unless you are under
license from the original author, or you have bought out the

other parties rights, such as I have done with a few hundred other packages as well.

Now that I have hopefully done an adequate job of explaining the sticky stuff, lets get on to a better note... I am planning in the near future to make the Pirates Treasure Chest, as well as all current Shadow Software holdings, available on the web as Fair-Ware.. I will try to at least get the Pirates Treasure Chest up to everyone fairly quickly. Carina BBS should already be available, and as time permits, we are working on getting everything available once again. As I type this, I have others working on typing up the manuals into text files, so that total distribution can be acheived on-line, and we will even have a way for you to pay on-line as well.

For anyone who may not be familiar with Fair-Ware, this is a concept which I came up with quite a few years ago, in which it is basically Share-Ware, except that it has no set firm price. Instead, I believe that the quality of all Shadow Software products can speak for itself, and I rely on the end user to make a fair donation based on their ability to pay, and how much they like the software. All Shadow SOftware products are still supported totally by us.

The Shadow

Cross-posted to: rec.games.video.nintendo,rec.games.video.sega,rec.games.video.3do,comp.sys.cbm,comp.sys.atari.8bit,rec.games.video.atari,rec.games.video.sony,rec.games.video.cd-i,comp.sys.ti,comp.sys.tandy,rec.games.video.classic

sorry about multiple posting.

: 1) I downloaded them from several different locations, over a 1-2 year
: period of time.

'kay..

: 2) I did NOT remove any company credits (they are, after all, the
: copyright holders). I also plan on adding this information to the
: files that are missing it, as soon as I can.

yippee.. :) a bit beside the point though. nintendo sued blockbuster video becuase BBV was making photocopies of manuals; these had all the copyright info in them, of course. these manual .txt files is the same matter, and either way, i'm not saying you removed company credits. you removed the credits of the ppl responsible for getting those .txt files you stole in the first place.

: 3) I added a general "thank you" at the front of the manual archive
: section.

huh. like that makes up for the theft of an entire section of my web page. ah well.

: 5) I added a note at the end stating where the file was located.

correctly speaking, it's located at my site, and/or nes world, and/or whoever else would like to keep it as long as they don't remove the credit for whoever made it a .txt file.

: [some gchance stuff]
: isn't the only offender, just the worst). I'm paying for the storage,

like no one else is

: I'm a little surprised that you'd bring this up. After all, if I knew
: of a misspelled word (as you apparently did) I would have corrected it
: by now. :)

i was just proving the theft. is all.

: >you'll also see how michael
: >removed the "From: tsr@www.komkon.org" line on the version on my page. i
: >put that line there for a reason.
:
: Yes, and I removed it for a reason.

care to tell me why? :)

: placing them on my web site, you can take them. Do you know why? I
: don't hold the copyright on them. And if you want to include credit
: lines in the files on your system, thats fine. Its not that I don't
: appreciate the work involved, because I do.

you certainly didn't seem to show it when you stole all those nes
manuals.

: After doing almost 1700 ORIGINAL game screen shots (if you knew how
: long it took sometimes to get a single *decent* screen shot, you'd
: honestly wonder how I did that many)

why, yes, i do. i'm sick of my snappy, personally. :)

: [some screenshot stuff]
: copyrights to the actual screen shots, although I make no claim to the
: rights to the characters or actual game (open any video game magazine,
: and you'll find that they operate the same way). And by the way,
: everyone who has asked me has been granted permission.

that's nice; could you have asked me for permission before your theft?
i'm sure it would have been given.

: Simply typing in, or scanning/editing a manual doesn't afford you any
: copyright claim. And since it doesn't, and the most important thing
: is getting the manuals into the hands of those who need them, don't
: you think that this is a pretty silly thing to get upset about?

the thing that strikes me as silly is that you actually sat down, over
the course of the time you spent collecting the manuals, and edited out
the credit for the person who made the file from -every single one- of
the manuals.

um, look. i don't care if you put up the manuals i typed in on yer site,
as mentioned before. i don't care if you make little editing changes here
or there if you like. could you just give me some credit for typing in all
those manuals, for chrissakes?

-tsr

1051. Re: Game screen shots and manual archive (08/06/97)

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-09 00:00:00 UTC
From: jvmatthe@unity.ncsu.edu
Message-ID: <5sgebh$hfh@uni00nw.unity.ncsu.edu>

Thus Spake Michael J. Novak Jr. (vga2000@ix.netcom.com):
: I won't be surprised if he responds to this, really. I mean he has
: done things before where he was flat out wrong and then he always
: followed up on them, which only made him look worse. For
: example, remember when he and WRB tried to play a bait-and-switch with
: the truth back in '95. They challenged me to prove them wrong, and I
: did so. They still haven't admitted they were wrong.

Hopefully all the rest of the folks read my post a few weeks ago about
the Mike breaking his own ``rules''. That should put the above and
below stuff more in perspective. Anyway, if you *really* have to know
what happened between me, Ruffin, and Novak just drop me a line; I won't
waste anymore time here with it. Actually, I think that proof that
Mike posts below is pretty silly.

: (as for Whiny Reinie, I never say those posts. He knows damn well
: what he lied about, and you do too!)

So tell us. Reinhard has said before that you won't prove him wrong in
public because you can't. Telling us we know he lied is not proof. So
step up and prove he's a liar.

matt

BTW, last post on all these ngs. Hope y'all enjoyed the show.

Hello!

I do not have a Snappy (wish I did), so I am hoping someone out there can assist me in a project I am working on. I have written a small BASIC program that displays all 256 colors, 16 at a time (total 16 screens). If you have a snappy or other video capture device that can get colors fairly accurately, and an Atari 8 bit computer (400/800/800XL/1200XL/XE, etc!) please email me and I will give you the program.

Thanks a lot for your help!
Jeff (calamari)

Source record: 71070

For those of you who own the cart but don't have instructions, B&C sells them for under $5 I believe. They are cataloged as "Easter Front II".

There are some big changes from the old cassette version to cart.

From: Daniel Woodard <woodardd@dma.org>
Message-ID: <5shkeb$eg7$1@sally.dma.org>
Source record: 71071

Eastern Front was the first strategy wargame that I played on any platform. My cousin had an Atari 800XL in the late 80's, and I found an excuse to play EF every time I visited. I really enjoyed it, and it is probably the reason that I now am into playing strategy games of all sorts.

The insert (0) key on the keypad.

Sadly, Darek apparently doesn't know the meaning of keyboard
interrupts... you really need a joystick or gamepad to enjoy xformer
joystick support... and for all that you might as well be using XL-it
;-)

Closer To Home BBS is now accessible via telnet. This is not to be confused with Closer To Home BBS Systems in Australia. This is the one that has been in service in the U.S. since 1986. The telnet server complements CTH's web and ftp services, and helps to support those that use lynx.

The bbs features Atari 8bit message bases and files.

1069. FS/T: Atari 8-bit computer items [08/10/97]

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-10 00:00:00 UTC
From: vga2000@ix.netcom.com
Message-ID: <33f0d5d0.12426012@nntp.ix.netcom.com>
Source record: 70989

All Video Game Advantage (VGA) FS/T lists are updated weekly and are
available on the WWW at http://www.io.com/~vga2000/

'Sales Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *before*
asking any questions, or placing any orders. Thank you!

This list was last updated on 08/08/97

NOTE: There are currently 1669 ORIGINAL game screen shots available
on my web site, including 52 for the Atari 8-bit computers!

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari 8-bit computers, at this time...

I have the following Atari 8-bit software, hardware, and accessories
for sale or trade.

There are a few items that are listed as untested. When I bought
these items I was told that they all worked, but due to a lack of
time, I have been unable to test them myself.

SOFTWARE:

NOTE: If the company name isn't listed, then the game was released
by the same company as the system.

NOTE: All cartridges are loose (ie. without box and manual), unless
specified.

NOTE: Since all cartridges are used, some labels will have small
defects. Major defects will be listed.

ATARI 8-BIT COMPUTER:

{1} = requires 32K.
{2} = requires 48K.
{3} = requires 48K and printer.

Used diskette(s), with box and manual:
$ 9.00 Home Filing Manager, The (Atari)
$ 9.00 Print Shop, The (Br0derbund) {3}
$ 9.00 SynFile+ (synapse) {2} -- also includes Reference Card
$ 9.00 Timewise (Atari) {1}
$ 9.00 Touchdown Football (Electronic Arts) {2}
$ 9.00 VisiCalc (VisiCorp) {1} -- also includes Pocket Reference
Guide -- $5 shipping, due to weight, counts as 1st item

Loose cartridges, no box or manual:
$ 4.00 Atariwriter
$10.00 Ballblazer -- XE cartridge
$ 4.00 Basic -- for use with the Atari 400 and 800
$ 5.00 Centipede
$ 9.00 Delta Drawing [Spinnaker]
$ 8.00 Frogger [Parker Brothers]
$ 2.50 Missile Command
$10.00 Movie Musical Madness [CBS Software]
$ 8.00 Qix
$ 2.50 Space Invaders
$ 4.00 Star Raiders

Cartridges with case and manual:
$14.00 Alphabet Zoo [Spinnaker]

Accessories:
$ 1.00 "A Note Regarding Software" letter: Atari Home Computers
-- some rips
$ 3.00 Atari 1050 Disk Drive Owner's Guide (8 pages).
$ 9.00 Atari 65XE Personal Computer Owner's Manual (126 pages).
$ 5.00 Atari 800XL Home Computer Owner's Guide (22 pages).
$ 5.00 Atari BASIC Reference Guide: For Experienced Programmers
(14 pages).
$ 7.00 Atari Disk Operating System Reference Manual: DOS 3
(100 pages).
$ 5.00 Atari Home Computers: The Next Generation catalog
(32 pages).

HARDWARE:

NOTE: The Lots listed below include only what is listed!

LOT #1

NEW RF SWITCHBOX PURCHASE OPTION

ATARI 400 COMPUTER with power supply, built-in RCA cable, one
Atari Joystick, and three [3] cartridges [no boxes, or manuals
for cartridges]:

Basic -- for use with the Atari 400 and 800
Missile Command
Space Invaders

This is a complete system, except for RF switchbox. This system
also includes the Atari 410 Program Recorder (listed below), at no
additional charge.

$32.00

*****

LOT #2

ATARI 1050 (127K) DISK DRIVE, with power supply and Molex
connector cable.

$35.00

*****

LOT #3

ATARI 1050 (127K) DISK DRIVE.

This disk drive doesn't include the power supply, or Molex
connector cable.

$20.00

*****

LOT #4

ATARI 410 PROGRAM RECORDER, with built-in power cord and Molex
connector cable.

This item has not been tested.

$ 4.00

*****

LOT #5

ATARI 820 PRINTER, with two (2) rolls of paper and built-in
power cord.

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$ 9.00

*****

LOT #6

OKIMATE 10 COLOR PRINTER, with built-in power cord, "Learn to Print"
Atari DOS 2.0 and 3.0 disk, "Learn to Print" cassette tape [for
400/800, 800XL, 1200XL and 600XL], and extra ribbon (Okidata).

This item has not been tested.

I have plugged in this printer, and after powering it up the power
light came on and the print head moved.

$12.00

*****

LOT #7

EPSON RX-80 PRINTER with built-in power cord.

$22.00

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.00 for the first disk-based software item and $1.25 for each additional disk-based software item, unless otherwise listed. Foreign orders welcome.

Large orders will be weighed as a package, to reduce shipping costs.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for something that isn't listed, please don't ask (because if I had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and systems have been tested and are in working order. I very rarely sell items that aren't working, but if I do, they are clearly labeled as such.

3) Trade offers, in particular for items that I need, will be considered (especially if the trade offer overwhelms me). I collect for over 50 different systems, so please feel free to send me a trade list. My want lists are on my web site.

4) Buyer has ten (10) days to send payment, and pays all shipping costs. Shipping cost depends on both the weight of the order and the distance that the order must travel, unless a set amount is already listed. No orders will be sent C.O.D.

5) Since items will be held specifically for you, if you aren't serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly listed.

7) If you have a problem with the listed price, please remember that nobody is forcing you to buy from me. I have been in business since 09/05/93, so I have a good idea how to price items. My personal philosophy is that something is only worth what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either check, money order -drawn from a U.S. bank branch-, or cash. Orders from outside the U.S. are also accepted (also, please check out my want lists, since some items are only available outside the U.S.)

9) I reserve the right to refuse any sale or trade offer, and to correct mistakes made while typing this message.

*****

ORDERING INSTRUCTIONS:

To reserve any item(s) listed here, please do the following:

1) carefully read the SALE CONDITIONS section first,
2) please make sure that you are able to follow through on your
order *before* you place it,
3) next send me a list of the items that you are interested in,
4) also include your full name and full postal mailing address
(this information is for internal VGA use only)!
5) I will reply with a shipping information message for your order.

Thank you!

Star Raider "I" is simply called Star Raiders. It came on a ROM cartridge. I think it was one of the first games done (copyright 1979) for the Atari 8-bits.

1071. Ben Poehland's video upgrades

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-10 00:00:00 UTC
From: Alan Sharkis <asharkis@erols.com>
Message-ID: <33EDBC2A.3722@erols.com>
Source record: 70991

I don't remember who asked for this, but I was recently in contact with Ben Poehland. He has doubts that posting the text alone (without the illustrations) would allow somebody to do the mods correctly. He also feels that Bob Wooley should be asked if there are any objections, since the mods were last published in AC.

Bob, if you're there, can you comment?

Also, Ben has no objections to posting his e-mail address here, but he states that he won't be able to answer all the mail that people in the newsgroup might send him.

Soooo, here goes:

b.poehland@juno.com

I hope this helps.

1072. Crosscheck by Datasoft

'The Last Starfighter' was a bona-fide game written by, I believe, Epyx.
Maybe someone knows for sure...

It came out as part of the promotional merchandising blitz for the movie,
'The Last Starfighter,' which was one of the first movies to use computer
graphics for special effects. Fun movie, too.

1075. REQ: INFO RE. 8 BIT ARCHIVES ON THE WEB.

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-10 00:00:00 UTC
From: bday@sos.netkonect.co.uk
Message-ID: <bday-ya02408000R1008972216160001@news2.netkonect.co.uk>
Source record: 70995
Cross-posted to: alt.binaries.comp.atari8bit,alt.binaries.warez.atari8bit,comp.sys.atari.8bit,rec.games.video.atari

Hi all.

I'd like to request some info about Atari 8-bit archives on the 'web.
Several months ago I found a page and consequently an archive run by a guy
called "Yogi" I bookmarked the pages.Since then I have had to quit the web
for financial reasons but have just reconnected. Now those pages seem to
have disappeared.I've read several messages in this group but found nothing
on this subject has come up. Can anyone tell me where they've gone?.I'm
about to register a program called "RAINBOW" which I'm sure a lot of you
will know about,but without games it seems a bit pointless.Much as I'd like
to get originals,that's out of the question as I'm still out of work.

Any info would be gratefully received,

Cheers Bazz.

PS I have tried the UMICH archives but they don't have anywhere near what
was on the other pages.

1079. AtariWriter Plus Question:

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-10 00:00:00 UTC
From: Douglas Feldman <dafeldman@worldnet.att.net>
Message-ID: <33EE7C64.27A9@worldnet.att.net>
Source record: 70999

I have the original disk for AW+ XL/XE. I also have a version that was modified for use with SpartaDOS (AP.OBJ for XE). BUT, I cannot seem to get any of these versions to work while my APE is connected. I even tried using the original disk in "real" drive #1 and just having APE connected by daisy chain. The program boots but will not recognize my real disk or any of the APE drives.

I also tried to get my Atari (130XE) to boot from my ATR image of my AtariWriterPlus disk (using DISKWIZ II) via APE set as d1:. That did not work either.

Any comments or advice? I am able to get Antic Writer to work via APE. But I would really like to get AW+ working in this environment.

Thanks for any help........

1080. Help with Win64/Xl-it!

How does an ST mouse connect with an XE? Without knowing how the mouse actually works, I'm afraid I can't say for sure how to write a wedge for the OS.

For the mouse to use the PADDLE function, it would have to have 2 joystick connectors, one for the horizontal movement and one for the vertical. A paddle is nothing much more than a linear potentiometer, and as such, it can only report one positional movement. That's why my first thought was to custom build one, although it would make for one cumbersome beast!

My Assembler days are long past me now, so I wouldn't be very good at writing a routine for you. Maybe someone else out there has done it?

Steven

That's hardly good enough, Mike! It takes a long time to type in those manuals! Now, I agree that people shouldn't have linked to your pages without your permission, but two wrongs don't make a right. And, as for copyright issues, many of those manuals contain original ASCII-art and comments that are NOT owned by the manufacturers, and ceratinly not by you!

That's a problem of the emulator. The keyboard problem is caused by the rather strange way how keyboard interrupts are handled in this game (the interrupt flag of the CPU is usually set and only very briefly enabled to allow the keyboard IRQ to occure) and the unability of the emulator to check the interrupts properly. Had a similar problem with the emulator by David Firth, but I fixed it now in the sources.

Star Raider 1 is called Star Raiders.

The Last Starfighter was the name of a game that Atari was going to
release in conjunction with a terrible movie of the same name. The movie
flopped, and the game didn't make it out the door in time (or so the story
goes). Later Atari tried to salvage something from the effort, and
instead released it as Star Raiders II. The games are basically
identical, although with the Star Raiders name on it, it makes no sense as
it takes place in an entirely different "world" than the original Star
Raiders.

I still don't get how a BASIC PADDLE() will return anything meaningful
from any mouse. Every non-serial mouse I've seen uses two digital
lines to encode quadrature(?) for each direction. (4 digital lines
total) The values are sampled very frequently (more than a few times
per video frame) to get accurate results.

OK, so you're telling me that Shadow Software is the real author of
the programs that make up the Pirates Treasure Chest. Why was there
no acknowledgement of this fact by Gardner Computing?

>A distribution Copyright has nothing to do with distribution
>rights, as far as the Copyright owner is concerned, only

>
>The Shadow

Look, I'm not trying to be a pain here, but I just don't get it. In any other business, anything you write under company time belongs to the company and if it goes out of business, the rights to the materials go with it. So if a piece of software was written that bears the name Gardner Computing, and Gardner Computing is now out of business, the original writer of the software cannot touch it, unless it can be proven that someone outside of the company wrote it, and that proof is in registering it with the Library of Congress, which in this case it has not been.

I've seen enough of this newsgroup to know that piracy of old software is a big issue here, but the real pirates did there damage over 10 years ago. What we're left with is the result of that piracy: official Atari 8-bit support is DEAD, any way you look at it. We now have a group of people who want to keep the unofficial support alive, and if that means free copies of all the possible software you can get your hands on, then so be it. Why are we debating copyright issues, 13 years after the fact, when Gardner Computing is out of business, Shadow Software can't produce a legal copyright letter, and no lawyer in the country would want to handle a case like that?

In case anyone else hasn't been following the other threads, I DO own a personal copy of the PTC, that I bought in 1984. I'm not trying to sell it; I only had a request for a copy of the sector copy program that is on it. This has raised quite a fuss on the NG, most of which has come to me in personal e-mail, and I'd rather not discuss what others have said in private.

How much longer are we going to have to pay for arcane programs? Atarians know that they're not worthless programs, but come on, I could do some of the same tasks 115.61 times better with my Pentium Pro 200 (200MHz/1.73MHz)! If I can buy a new program for $60, then a year later see it for $10, what's the depreciation on 13 years? 4.593936579978e-9, according to MY calculator. Anybody remember E-notation? By that calculation, the $60 program isn't even worth one penny after 5 years. Should the Atari software be any different?

I'm starting to feel like others in this group. I'd rather not even load Free Agent in the mornings, than feel like others still want to make money off of the Atari.

Am I alone here? I don't think so.
Steven

1099. Rainbow vs. XL-It

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-11 00:00:00 UTC
From: Tony Ramos <tony_ramos@fitch.com>
Message-ID: <33EF79CA.22CB@fitch.com>
Source record: 71019

Hello everyone,

I'm considering registering one of these Atari 8-bit emulators, but I could use a little more information.

I was set on Rainbow until I heard that it can't deal with disk images larger than enhanced density. Is this true?

Next I tried to check out the newest version of XL-It (.20) but the home page doesn't respond. Version .16 seems poor in comparison to Rainbow. Sound in particular is bad, using samples instead of true emulation.

I want to register one of these...if a satisfied customer could answer these questions and/or provide ver. .20 of XL-It I would greatly appreciate it.

Thanks,
Tony R.

1100. New Atari8-bit emulator for Win32 (9X/NT)

I've ported David Firth's Atari800 to Win32 & DirectX. The home page is here:

http://www.cris.com/~Twist/atari800win

(this page will be updated as new versions come out)

This being the first version there are bound to be problems (a few of which I already know about and are listed in the bugs.txt document). However I was able to play plenty of games of MULE and Archon, among lots of other things.

Your address bounces, you have no valid e-mail in header or
your message. This is the wrong group, there is/are ST usenet
groups, but they aren't very active. I wanna make a comment.
You're on the right track with 'KnifeST', which I presume is
a ST sector editor/copier/fixer program. One suggestion.
Find a way to make a sector copy of this valuable disk, with
trashed FAT and everything. The edit the copy. Maybe make
two or three sector copy backups and keep the original intact,
intact as in messed up, but recoverable, probably for your
midi file.
If you don't understand the difference between a 'sector'
copied disk and a copy of a disk where you copy all the
files, uhm... figure it out, it is probably (sector copying)
a function available on the 'KnifeST' you have there.
Verify the sector copies if you can by setting the verify
on in the sector editor/floppy disk utility you are using.

That all depends on how long you want to look. If you have the patience to wait it out for months, looking all over the place, sure, maybe you can find one for $5-10. (I found a perfectly good one at a Goodwill store for $6.99 a couple of years ago.)

Unless we view going all over the place and looking for the best buy as an enjoyable hobby, I'd imagine most of us would just prefer to pay the $15-30 I usually see requested and not waste so much time trying to find the very best price.

It's not like we're talking about hundreds or thousands of dollars here.

> if they don't even include a PS.

Well, congrats to you, but just because you got one for $3 doesn't mean
that's the going rate. Like a lot of things of this nature, there is no
"price guide" and you can only look at the range of transactions.

Usually, for an 800 XL the average seems to be around $15-25, plus another
$10 or so for a power supply, which are getting harder to find.

I've seen 'em as cheap as $5 and as expensive as $40-50, with occasional
dreamers wanting $100 or so. Maybe a complete system with 2 disk drives,
all power supplies and software might be worth $100, but a plain 800XL
isn't even close.

1111. Important update from DGS

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-12 00:00:00 UTC
From: DGS <dgs@clara.net>
Message-ID: <5sqduqkbq1@eros.clara.net>
Source record: 70934

In our PD/Commercial catalogue on our web site, we say that we can accept International Money Orders made out in UK Pounds Sterling. While this is still the case, it has not been mentioned that this payment method is subject to a substantial bank handling fee (about 10 pounds minimum) which has to be passed on to the customer (we don't make enough to cover it!!). If you have ordered by IMO you will be advised on arrival of your order. Either the IMO will be returned for replacement or the balance can be sent to us in cash. It is still the prefered method to pay in CASH in US$ for US customers, and CASH in UK pounds for elsewhere. European customers may also pay by Eurocheque made out in UK pounds. Our catalogues have been updated with this new information.

Sorry for this oversight.

Dean Garraghty.

XL-it! is free, so no problem there, and Rainbow, being £15 is well worth it.
If you were only going to get one anyway, may as well make it Rainbow and get
the other for free!

Atari 2600 items/8-bit Auction #4B
---------------------------------------------------------------
Hi Everyone. Here is my listing and a few simple rules:
Bidders must supply full name, address, and phone number.
Otherwise, bids will not be accepted. I've had to many
people agree to buy an item and then pull-out.
Buyer pays post office shipping from Canada.
All prices in USD. Canadians can pay in equivalent $CDN.
I will keep you posted on the current high bid(s).
All items are in good working condition(unless noted)
but sold AS IS.

Auction ends 11:59 PM CST August 16th, 1997(Or sooner)

NOTE: Please bid on individual items, no bulk bids.

Thanks.
David

1114. Only 11 questions, please help :)

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-12 00:00:00 UTC
From: AsciiRider <andreadd@concentric.net>
Message-ID: <33F147D1.1CB8@concentric.net>
Source record: 70937

I have a number of questions:

I am pretty well versed in Atarispeak. I have an 800xl,
2 1050's, APE, and an indus that just died yesterday, Tons of manuals,
and I am
excited about the 75 or so Antic magz I just purchased.

Anyway!

Most of my questions relate to SIO2PC/APE. I am trying to make the most
of the 16 megabyte drives.

Are there any SpartaDos 3.2g friendly text editors (single executable)
out there with
subdirectory support? (80 columns wouldn't hurt) I would like to be
able to run it from
my "hard drive" and exit out to Sparta easily. I just can't do it with
AtariWriter.

How do I exit to BASIC from Sparta? I believe BASIC ON just turns it on
internally.

How about a SpartaDos friendly "TRANSLATOR"?

Anything that I could run that would give control to Sparta whenever I
press reset instead
of handing control back to the same program or coldstarting?

Is there a super copy program out there to run on the Atari that will
copy any of the
protected software images down to a floppy? And if there isn't, how the
heck did someone
create the image in the first place?

As mentioned earlier, my Indus GT just pooped out on me yesterday. Any
suggestions? Something
common that maybe could help? It happended during a format. No problems
before that.

How the heck do you load a Zork saved gamed? LOAD doesn't seem to
work. I can't remember
what I did in 1988.

How do you move files in Sparta?

I have noticed that when I copy Atari Dos 2.0/5/s binaries to Sparta, I
normally have to rename
the file with an .exe or some other extension before Sparta will even

find it. Anyway around
this? Am I doing something wrong?

I have also noticed that when using SIO2PC to play Alternate Reality, I
see a "cracked/hacked by
screen thingie. I don't see this in the Shareware APE distribution.
Anybody know why? Just
curious.

I picked up a 1mb 520st, mono monitor for $9 at a thrift store this
week. Does anybody know
a cheap source for power supplies and/or mouse? (I know it is 16bit,
but I really couldn't pass
it up being so stinking cheap.)

I hope that nobobdy thinks I'm a complainer or that I expect to much
from my 8bit,
I guess I really want to start programming this thing finally and I
don't want to
spend to much time working around these little inconvieniences.
<----probably spelled
that one wrong.

Does anybody have the telephone/bbs/homepage/email etc....for S.C.A.T.
Suburban Chicago Atarians?

Any help would be greatly appreciated.

Thanks
_AscIiRideR

>(remove antispam from email to reply)

Are your shure you plug in that cable on the parallel Connector? The
2nd Thing is: you don't need all cabels by the original SIO-Cable :
Are your sure, that the not usally strips are all isolated and make
not a bridge? This problem was my problem :-)

I have the following items for sale:

Atari 800 computer, 48K RAM, Fast Chip upgrade installed. Some of the keys work perfectly, others you have to hit a little bit harder. I suspect this could be fixed by cleaning the keyboard. Atari BASIC cart included. I don't have the power supply. $15

Indus GT disk drive, with power supply, DOS-XL 2.20, word processor, database, and spreadsheet software. All original manuals for the drive and software are included. $30

Prices do not include shipping. I am in Dayton, Ohio.

you plug the st-mouse connector just into the joystick port, preferably in Port 2, so it won't get in trouble with standard joystick applications (i.e. games)..

> For the mouse to use the PADDLE function, it would have to have 2
> joystick connectors, one for the horizontal movement and one for the
> vertical. A paddle is nothing much more than a linear potentiometer,
> and as such, it can only report one positional movement. That's why
> my first thought was to custom build one, although it would make for
> one cumbersome beast!

no. That's the wrong way. I know that it must work with a single joy - port. The S.A.M. package or quick language has already fast mouse routines, and are really usefull!

> My Assembler days are long past me now, so I wouldn't be very good at
> writing a routine for you. Maybe someone else out there has done it?

my problem isn't the program source, I need some instruction how I could read out a relative x and y pos.

You have to remember something about B&C. They have their place for someone looking for a comprehensive selection in stock, but the prices are probably twice that of what you could find if you tried hard enough and looked long enough.

I've bought a lot from B&C and would continue to do so, but for a savy person they probably aren't the first place you'd look to get something, aas they'd likely charge you $20 for something you could find for $10.

I'm grateful they're around, but they're not the first place I look for things I want.

Why not try opening the drive door, taking the disk out and putting the next
one in when the program asks? (hint: comp.sys.cbm is for real computers.
Try comp.emulators.cbm in the future).

In article <33EE8B07.7953@ibm.net>, sixosix@ibm.net says...

Do you hace the LVAUG patch to Atariwriter? It makes AW+ Sparta compatible and usable from HD. I'm sure someone has a copy they could forward to you. I might even still have it. It is shareware so it should be registered.

>
>How do I exit to BASIC from Sparta? I believe BASIC ON just turns it on
>internally.
>

At the DOS prompt type CAR and hit enter. This will execute the cartridge (whatever cart is plugged in). If you are using BASIC XE and have the extensions file and a 130XE or upgraded XL, be sure the extensions file is on D1: and you execute CAR at D1: so it loads properly.

>How about a SpartaDos friendly "TRANSLATOR"?

SD (except for SDX cart) is not compatible with the 800 since you need the RAM under the cart (at least 64KB of total RAM).

There have been many, but they usually require extra hardware. One is the BlackBox with the Super Archiver, another was the Happy Drive. There were others, but I don't remember at the moment.
Commercial copying of protected disks use special equipment that are analog in nature as oppose to the digital nature of a floppy drive. They copy the magnetic pulses not the binary data.

>

Most likely you have to boot the system from the Zork disk. I don't know, since I never owned this game.

>How do you move files in Sparta?
>

There are two ways. 1) a seperate program called MOVE.COM which, unlike the MS-DOS version, simply moves the directory info from one directory to another ON THE SAME DISK ONLY!!! 2) copy the files to the new location then delete the original (this is what the MS-DOS version of move does (all in one command). As far as I know there isn't a version that works across disks for the 8-bit. I may be wrong on this one.

>I have noticed that when I copy Atari Dos 2.0/5/s binaries to Sparta, I
>normally have to rename
>the file with an .exe or some other extension before Sparta will even
>find it. Anyway around
>this? Am I doing something wrong?
>
No. Sparta will only execute binary load programs if they have a .COM extension. You have to enter the entire filename.ext the execute anything else. BATch files are something else. SD won't execute a file like BDASH2.EXE if to enter D1:BDASH2 [enter]. You have to have D1:BDASH2.EXE [enter] to execute this program. Just the nature of the beast. You see .COM is a COMmand program for SpartaDOS. EXEcutable programs are usually much more advanced than .COM programs. They weren't normally directly executed from the command line until Sparta became popular. AtariDOS made you do L then the drive and filename. MS-DOS had just started converting to .EXE programs too (remember this was very early in the PC age). SD never really got updated to do this.

That's it. I think it's a sequal. There is also Scraper Caper on cartridge. I want the BIN cartridge file to run on Rainbow. I have the bin.cartridge file of Miner2049er which runs on the Rainbow emulator for PC and Mac.
I also have the bountybobstrikesback.exe for Rainbow but don't know how to run it.

Ge> USSR or the Germans win.

True, but it matters, because as soon as winter sets in,
your army moves around slower because of the snow :)
This is as in real life, when the Germans were slowed down
because of frozen equipment, snow, etc.
The Russians had time to mobilize some troops again,
had supply lines (which the Germans lacked), etc.

Speed and time is of the essence here.
Bo.

As in Real life? Erp. Would the Soviets have simply sat twiddling their thumbs and let the Germans mill about aimlessly in the eastern front for months on end until weather conditions favored a German assault? Ok, maybe :-)

Pretty much yeah, they sat there all through '39 and '40, and fully
expected to continue that way for some indefinite time into the future.

The real reason this "trick" works though is that the games ends very
quickly thereafter, and it doesn't give the computer time to gather it's
forces and gang up on you.

Maury

Just an extended note to this. PKUNZIP and Winzip are for the PC not the Atari 8-bit, so once you decompress the files you need to copy/move them to you 8-bit. This can be done via SIO2PC/APE, term programs and a null modem cable or via PC XFormer and the XF Cable.

1149. Emacs subset for the Atari/XEP80 - Docs

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-13 00:00:00 UTC
From: slackey@slackey-sun.cisco.com
Message-ID: <SLACKEY.97Aug13134316@slackey-sun.cisco.com>
Source record: 70965

EMAX (Editor with Macro for the Atari with XEP80)

EMAX is intended to be a highly functional text editor for ATARI 8-bit computers. It is not a word processor, as another one is probably not needed. It is intended to be used mainly as a program editor, although it does have some word processor features. Its text editing interface is modelled after the industry standard program EMACS, but does not claim to have even a small fraction of that tool's power.

EMAX requires, and exploits, the XEP80 and 80-column monitor. Its features include:

XEP80 mode setup
Re-definable key commands
Lots of editing primitives
Ability to maintain several editing buffers, although only one screen window is implemented
File operations
Printer mode setup sequences
Program size is 5.5K, leaving at least 32K bytes of text space
Supports subdirectories

- Compatibility notes -

EMAX runs under [at least] MYDOS, ATARI DOS 2.5, DOS XE and SpartaDOS. I have not tested it under any other DOSes. Due to incompatibilities between these DOSes, some disk functions may not work; for example, the diskload operation, which lets you run another application without having to go back to DOS, only works under SpartaDOS. Note: You MUST use the Atari-supplied XEP80 driver; the subsetted one does not implement enough functionality.

A problem with MYDOS is that it kills the XEP80 handler when you enter DUP, but does not restart the standard monitor; in other words, you're hosed. I use a version of MYDOS DUP I modified myself, which does not have the problem. Another solution is to name the XEP80 driver AUTORUN.SYS and append EMAX to it, so DUP is never entered.

There are two versions of EMAX - EMAXR and EMAXS. The EMAXR version lives in RAM under the ROM in an XL/XE. Under MYDOS you get over 38K of text space. This is incompatible with SpartaDOS and DOS XE, as they live under the ROM too. The EMAXS version works with SpartaDOS, but it may not work under SpartaDOS X (I never tried it.) I don't remember if I tested it under DOS XE.

EMAX does not use 130XE extended RAM. You can still use extended RAM as a RAMdisk, though, if your OS supports it.

- Starting EMAX -

To start EMAX, boot without BASIC, and with the XEP80 handler from Atari. When you get the DUP.SYS menu, use the L function to load and run EMAX. If you wish EMAX to autoload, name the XEP80 handler AUTORUN.SYS, and append EMAX to it.

1. Mode setup

When EMAX starts, it looks for a file named D:EMAX.INI. This file contains all mode settings and key redefinitions. In order to be as general as possible, while keeping a limit on the load image size, the format of this file is simple. ALL CHARACTERS ARE UPPER CASE. It has five line formats:

A) X CMD AUX1 AUX2 DEV:

This format does any XIO function, intended for setting up XEP80 options. Refer to your XEP80 docs for all operations; I will list the most useful below.

In EMAX.INI, the format of this line is: The letter X is the first on the line. CMD, AUX1 and AUX2 are two-digit hexadecimal numbers, all separated by exactly one space. DEV: is the device, immediately followed by an ATASCII EOL (the normal carriage return for an Atari).

Examples of this command are:

Command	Function
X 17 01 00	P: Sets the printer to the serial line
X 14 0C D5	E: Sets international character set
X 14 0C D6	E: Sets internal character set
X 14 0C D8	E: Cursor off
X 14 0C D9	E: Cursor on
X 14 0C DA	E: Cursor blink
X 14 0C DE	E: White text on black background
X 14 0C DF	E: Black text on white background

Any XIO command can be issued in this manner, to any device. Be careful with this command; you can crash your system real good, as well as damage or delete disk files.

This command can be used to initialize your printer, by sending any character string(s). This is done by the following sequence:

```
X 03 08 00 P:
X 0B 08 00 string-to-go-to-the-printer
X 0B 08 00 another-string
X 0C 00 00 P:
```

The first line opens the printer for output; the second and third send setup strings; the last line closes the channel. Max string length is 60 chars. The string may have escape characters in it; see instructions for inserting the escape character. And, of course, make sure you close the channel!!

B) K KEY# FUNCTION#

This command lets you redefine key bindings. KEY# is a two-digit hexadecimal key number, and FUNCTION# is the two-digit hexadecimal function number. Tables are included below with the assignments, and defaults.

C) POKE

This function lets you poke any value anywhere in memory. It format is:

P ADDR DT

where ADDR is the address, expressed as exactly four hexadecimal digits, and DT is the data, exactly two hexadecimal digits. A 16-bit poke requires two lines in EMAX.INI. I use this command to shut off I/O beeping with the line:

P 0041 00

I don't think I have to warn you to be cautious.

D) @DEV:

The first character is the '@' sign, and DEV: (followed immediately by an EOL) is the device/filename to which EMAX.INI is to link. Thus, arbitrarily long or complex initialization sequences can be done. The INI files are not nested, so any lines following the @ command line are ignored. Note: If the DEV: is E:, control transfers to the keyboard for further manual input, in the format listed here.

NOTE: Any device you transfer control to is first OPENed. If you use the @E: function, this open operation clears any and all previously set up XEP80 modes. If you want to use @E:, make sure you do it only once.

E) Q

'Quit' command for keyboard mode. Causes initialization to terminate and for control to enter the editor. Note: A line containing the Q command need not be in EMAX.INI; any error reading EMAX.INI, including file-not-found, causes initialization to terminate.

E) #

A '#' sign as the first character indicates a comment; any other characters in this line will be ignored.

If an EMAX.INI file is not found, initialization is skipped and the editor is entered. If you want to play with the options, you could create a file called EMAX.INI with only an @E: in it; this transfers control to the keyboard. Make sure you enter a Q command when done.

Error reporting is minimal in this section as well as in general. Upon error, an inverse-video E is shown, followed by the error number in decimal. The program waits until any character is pressed, to make sure the user had time to see the response.

2. EMAX General Information

After initialization, EMAX enters editing mode. The screen will blank, and the title bar will appear at the bottom of the screen. At this point, any printing characters will be entered into the current buffer as they are typed, and just appear on the screen.

A) Buffers

A buffer is a group of characters which can be edited. The current buffer is the one which is currently being edited. Often, a buffer will correspond to a file; anytime a file is read, it is assigned to a buffer, and the filename is saved. A simple keypress can write back an edited version; another key writes back all modified buffers. There are 14 buffers, named A through N; they cannot be renamed.

The current buffer list can be displayed. The screen is cleared, and the buffer list is shown. From left to right: the buffer name (A-N), the filename it corresponds to (if any), the status, and the size in bytes. The status is 0 if the buffer is not in use; 1 if it is used but not modified (a file has been loaded), or 3 if it has been modified. (Read-Only mode is not supported.)

The last line in the buffer list, labelled as buffer O, is a dummy buffer used to indicate the number of free bytes in memory.

B) Kill Buffer and Cutting

In addition, a special buffer called the kill buffer is used for deleting, moving and replicating text. All commands that delete more than one character (like a word, line, or range) cause the deleted text to be placed in the kill buffer. The kill buffer can be reinserted back in place, and/or moved to other places to be reinserted. Thus, text can be typed once and duplicated any number of times.

The word "cutting" used below refers to deleting text from the current buffer and putting it into the kill buffer.

When text is cut by repeatedly pressing the same key, the subsequent pressings do not clear the buffer but append to it; thus, several lines or words can easily be put into the kill buffer to be moved, or duplicated.

The maximum size of the kill buffer is 1024 characters. When more text than that is to be moved, it must be done in more than one operation.

C) The Range and the Mark

A Range is a group of contiguous characters in a buffer. It is defined as that text between the cursor and the "mark". The mark is normally defined by placing the cursor at the desired place, and pressing the set-mark key. When the cursor is moved, the mark stays in its place. Other actions set the mark as described below.

D) Keyboard Macro

EMAX has a keyboard macro. It allows you to easily repeat a sequence of editing steps. You start macro definition, and start editing. All typed

keys go into a special buffer. After stopping definition, you can reexecute the saved commands anytime. The buffer has a size of 126 keys; if the definition exceeds 126 characters, the buffer is cleared.

E) Line Size

Lines greater than 80 characters are not displayed past column 79. A bright dot is shown where the line goes offscreen. There is no way to view those characters, other than by forcing a "wrap" by temporarily inserting an EOL.

F) Inverse Video

Inverse video characters work; alternate mode with the Atari key. It's a little confusing using control keys; EMAX interprets them as inverse video text. I suggest using a blinking cursor if you plan to edit inverse video.

G) Title Bar

During normal editing, the title bar is displayed, in inverse video, on the lowest line of the screen. The XEP80 offers a 25th line for this type of thing; 24 lines of text are always displayed.

The title bar, from left to right, shows a '(' if there is a keyboard macro being entered; '*' if the current buffer has been modified; the buffer name (a letter A-N); the name of the file associated with that buffer, if any; and the current default directory.

When a prompt is needed, for example to allow the user to input a filename or search string, the title bar disappears and line 25 is used for the command. When the command has finished executing, the title bar is redrawn.

H) Files

Editing a file using EMAX requires it to be loaded into a buffer. When this occurs, EMAX remembers the filename, associating it with the buffer it was loaded into. This makes it easy to edit, refer back and forth, and finally write back multiple modified files at the end of a session. This is to work around the small memory space of the Atari - making it easier to maintain a large file as a group of small files.

Unlike EMACS, EMAX does not remember which disk/directory a file was read from. It only remembers one disk/directory, the current default. In order to access a disk file, its disk/directory must be made the default, then the file read (or written, deleted, renamed, etc.) by its simple filename. Thus, if a file is read, and you change the current default then write the file, it will be written back to a different directory than its original.

The default disk/directory is simply a text string in EMAX; any default set in your DOS prior to running EMAX is not used for disk accesses, or modified when the EMAX default is changed. The default is simply a text string prepended to any filename used in file commands. Also, EMAX does not check for delimiters between subdirectory names, such as '>' used by MYDOS; when setting a new default disk/directory, you must include delimiters within, and at the end of, the directory name.

EMAX initializes the default to 'D1:'.

When EMAX is to read in a file, it first determines if that filename is already associated with a buffer; if so, it switches to that buffer without actually reading the disk. Otherwise, it finds the next unused buffer, assigns it to that filename, and reads the file into that buffer. If it is too large, the user is given all that would fit, and the file is closed. CAUTION: If a truncated file ends up being written back, all text past the point that would originally fit will be lost.

When using the 'find file' function, do not use wildcards; the wildcarded version of the filename is stored, and used to write back. Depending upon your DOS, this may do things you don't expect.

3. Editing Primitives and File Functions

Listed below is a full description of the primitives. Each of these can be initiated by a control key (a key pressed while pressing the CONTROL key), a control key following shift key #1, or a plain key following shift key #2. In some cases EMAX will prompt for more information, such as a filename.

Below with the functions are listed the default bindings. The default bindings for the shift keys are Control-X for shift #1, and Escape for Shift #2. Note that normally a control key must follow Control-X (shift-1), and a non-control key (possibly SHIFTed) follows Escape (shift-2). One function can be bound to more than one key.

Left, Right, Up, and Down refer to the arrow keys. The Control key must be pressed.

A) Editing primitives

Function name F# Default Comment
------------------- -- --------- ------------
backwards-word 09 Escape-B Moves cursor backwards one word
Control-I
beginning-of-buffer 3E Escape-[Move cursor after placing mark
Ctl-X Left
beginning-of-line 01 Control-A Moves cursor to beginning of line
beginning-of-next-line 16 Escape-E Moves cursor
change-case 0D Control-M Change case of character under cursor
cursor-left 02 Control-B
Left
cursor-right 06 Control-F
Right
cut-line 0B Control-K -
Cuts to end of line. If at end of line, cuts the EOL character. Repeated Control-K is commonly used to cut and move sections of text.
cut-range 17 Control-W Cuts the range, loads the kill buffer
cut-backwards-word 08 Escape-Delete Kills a word
Control-H
Escape-^
cut-beginning-of-line 15 Control-U

delete-char 04 Control-D Deletes forward one character
delete-backwards-char 40 Delete
delete-word 0A Control-J
Escape-D
end-of-buffer 3F Escape-] Move cursor after placing mark
Ctl-X Right
end-of-line 05 Control-E Move cursor after placing mark
end-of-previous-line 1A Control-Z
exchange-point-and-mark 38 Ctl-X Ctl-X Exchanges current cursor position
and the mark
execute-keyboard-macro 25 Ctl-X Ctl-E Re-executes keyboard macro
fill-region 07 Escape-G Replaces spaces and EOLs to put the
maximum number of words on each line,
the line width set by the FILL variable
forward-word 0F Escape-F Move forward to next word
next-line 0E Control-N Move cursor down one line
no-function 20 Control-G Does nothing. Used to cancel shift
Ctl-X Ctl-G keys, and certain other functions
Escape Ctl-G
not-modified 1E Escape-_ Mark buffer as not modified. This
prevents it from being automatically
written back
open-line 2F Control-O Insert EOL, then move cursor back one
previous-line 10 Control-P Move cursor up one line
Up
query-replace 32 Escape-R -
Prompts for a search string (delimited by RETURN), then the replacement
string. Searches for the next occurrance. If you wish to replace the
occurrance, hit the space bar; if you wish to skip that occurrance hit
DELETE; to just replace all following occurrances, type '!'. Any other key
cancels the command entirely. Caution: the cancelling key is executed
as if it had been entered outside the replace command; Control-G is
recommended as the cancelling key. The title bar reappears when the
command is done.
quoted-insert 11 Control-Q Next char will be inserted, even if a
control char
recenter 0C Control-L Redraws the screen, centering cursor
redraw 21 Ctl-X Ctl-A Redraw screen without moving it
scroll-down 3C Escape-V Scroll screen down one screenful. Move
Ctl-X Up cursor if needed to keep it onscreen.
scroll-down-line 1C Up Scroll screen down one line
scroll-up 3D Control-V Scroll screen up one screenful
Ctl-X Down
scroll-up-line 1D Down Scroll screen up one line
search-backward 12 Control-R
Prompt for a search string, and search backward for it. If it is not
found, the screen or cursor position are not changed in any way. If found,
the mark is set and the cursor is moved. There is more on search strings
under Prompts in chapter 4.
search-forward 13 Control-S Prompt for search string, search fwd

set-fill-column 2A Ctl-X Ctl-J Set the right column for the FILL
function. Prompts for the new column
number
set-mark 00 Control-, Place the mark at the current cursor
Control-2 position
shift-1 18 Control-X Shift key #1
shift-2 1B Escape Shift key #2
transpose-characters 14 Control-T Transpose char. under cursor with
previous. If at EOL, transpose 2 prev.
characters
yank 19 Control-Y Yank (undelete) the last cut back into
the current buffer at the cursor

B) Buffer Functions

buffers 22 Ctl-X Ctl-B
Shows the current buffer list: the buffer names, the filenames corresponding
to them, the flag, and the size. The current buffer is marked with an '*'.
EMAX waits for another input; if it is a letter from a-n, it switches to
that buffer; a control key sets it to accept that command (such as
Ctl-X Ctl-F to read in a file); any other key returns to edit the current
buffer. Note: When there is a lot of text in memory, delays can be
noticeable.
kill-buffer 2B Ctl-X Ctl-K
Kills the current buffer. Careful; it's gone! Also kills the filename
with the buffer, if there is one. Waits for confirmation; 'Y' executes.
insert-buffer 29 Ctl-X Ctl-I
Inserts a buffer at the cursor. Prompts for the buffer name (A-N) to
insert into the current buffer. If memory size won't permit, the moved
text is truncated.
print-buffer 30 Escape-P Prints current buffer to P: device.
Does not detab

C) File Functions

Unless otherwise specified, all file functions prompt for a file name, the
prompt being a letter shown below, followed by the default directory.
Unless otherwise specified, a null response (just a RETURN) cancels the
command.

Note: Wildcard characters are processed by your operating system; EMAX
simply passes your response to the DOS via XIO for the actual processing.

Most errors are a result of disk accesses. Errors are displayed as an
inverse video 'E', followed by the error number in decimal. EMAX waits for
any character to be typed before going on, to make sure the user saw the
error response before possibly clearing it from the screen. (The keypress
is discarded.)

Function name F# Default Comment
------------------ -- --------- ------------
delete-file 36 Escape-X Prompt:X. Deletes file(s).

directory 24 Ctl-X Ctl-D Prompt:D. A null response passes the
string '*.*'
find-file 26 Ctl-X Ctl-F Prompt:F. Reads a file into a buffer
lock-file 2C Escape-L Prompt:L. Lock file against writes.
rename-file 2E Escape-N Prompt:N. Rename per your DOS require-
ments. For MYDOS/Atari DOS2, use:
OLDNAME.EXT,NEWNAME.EXT
make-subdirectory 31 Escape-M Prompt:M. Create a subdirectory. Works
using a simple XIO command.
run-binary 39 Escape-@ Prompt:R. Terminate EMAX, load and run
a binary file. Edits are lost.
set-default-directory 27 Escape-S
Prompt:G. Used for setting a different disk drive/subdirectory as the
default. If the new default contains a ':' as in 'D2:', the new string
replaces the old one; otherwise, it is appended to the old one.
write-to-default 33 Ctl-X Ctl-S
Writes the current buffer to its filename. If it does not have one, it
uses its buffer name ('A'-'N'). Marks the buffer not-modified.
unlock-file 35 Escape-U Prompt:U. Unlocks a previously locked
file.
write-to-filename 37 Ctl-X Ctl-W
Prompt:W. Writes buffer to a new filename. Replaces the buffer's associated
filename (if present) with the new one.
write-modified-buffers 2D Ctl-X Ctl-M Writes all modified buffers to the
current default. Lists them on the
screen, stopping at any error.

D) Miscellaneous

quit 3A Ctl-X Ctl-Z Leaves EMAX and returns to DUP. Any
modified buffers are lost. Waits for
confirmation: 'Y' proceeds.
write-and-quit 23 Ctl-X Ctl-C Writes back all modified buffers, then
returns to DUP. Stops and stays in
EMAX if any write causes an error.
reset-xep80 3B Ctl-X Ctl-R Resets the XEP80 (see last section)

E) Non-Redefineable Keys

The last of the functions, and their bindings, are not redefineable. They
are as follows:

start-keyboard-macro shift-1 (Begins definition of a keyboard macro.
Every keypress is saved in the macro buffer, while editing occurs. While
the macro is being defined, an '(' is shown in the left part of the title
bar.

end-keyboard-macro shift-1) Ends definition of a keyboard macro. Stops
putting keys into the macro, and makes it ready to execute. To execute the
keyboard macro, use execute-keyboard-macro (Ctl-X Ctl-E).

count Escape-<number> Sets EMAX to repeat the following command <number> times. <number> is echoed on the title line. The number is modulo-2**16, making the max 65,535. Caution: It is a modulo, so the number 65,536 will act a zero, etc. Count works both inside and outside a keyboard macro. Two counts are maintained, allowing Count operations in a macro to work properly when Count is used on the execute-keyboard-macro command.

Stop long count START button Prematurely stops execution of an operation repeating due to a count. You may need to hold the button down until it is detected.

Cancel screen update SELECT button Speeds up long operations (like a long keyboard macro with a large count, or a large replace operation) by cancelling screen output. The editing is still happening, but the screen is dead to allow the operations to execute faster. When the operation is done, the screen will be repainted. NOTE: There is a programming hack used - the end of the operation is done by acting as if a control-G was typed. You should not redefine control-G.

In the query-replace function, the SPACE, DELETE and ! operations are not redefineable.

4. Sumaries and Tables

A) Table 1. Key number (for redefinition), function number, and default bindings

CONTROL- CONTROL-X CONTROL- ESCAPE-
KEY# F# Function KEY# F# Function KEY# F# Function
---- -- ---------- ---- -- ---------- ---- -- ----------
00 , 00 set-mark 20 , 40 @ 39 run-binary
01 A 01 begin-of-line 21 A 21 redraw 41 A
02 B 02 cursor-left 22 B 22 buffers 42 B 09 backwards-word
03 C 23 C 23 write-and-quit 43 C
04 D 04 delete-char 24 D 24 directory 44 D 0A delete-word
05 E 05 end-of-line 25 E 25 execute-kbd-macro 45 E 16 begin-next-line
06 F 06 cursor-right 26 F 26 find-file 46 F 0F forward-word

1E Lf 02 cursor-left 3E Lf 3E begin-of-buffer 5E ^ 08 cut-back-word
1F Rt 06 cursor-right 3F Rt 3F end-of-buffer 5F _ 1E not-modified

Ctl-X (start-keyboard-macro
Ctl-X) end-keyboard-macro
Escape-<number> count
Delete 40 delete-backwards-char
Escape-DEL 08 cut-backwards-word (Note: Always is the same as Escape-^)
START button Stop a count
SELECT button Cancel screen output

Using this table: This table is a summary of the function list in chapter 3 sorted by key, but is also a table of the key numbering for key refinition. For example, to redefine the key Control-C to the function 'quit', in your EMAX.INI file you would have a line reading:

K 03 3A

'K' is the redefine-key directive, '03' is the key number for Control-C, and '3A' is the function number for 'quit'.

Other notes -

The Delete key is not redefineable, but the delete-backwards-char function is; just define the key to functon #40.

ESCAPE-Delete maps onto ESCAPE-^ (key# 5E). Redefining ESCAPE-^ redefines ESCAPE-Delete to the same function.

The key Control-, (control-comma) is the 'null' code. Control-space is not decoded by the Atari, and it would have required significant programming to fake it.

B) Table 2. Functions sorted by function number.

Function F# Default Binding(s)
---------------------- -- --------------------------
set-mark 00 Control-, Control-2
beginning-of-line 01 Control-A
cursor-left 02 Control-B Left
no-function 03
delete-char 04 Control-D
end-of-line 05 Control-E
cursor-right 06 Control-F Right
fill-region 07 Escape-G
cut-backwards-word 08 Control-H Escape-^ Escape-Delete

```
backwards-word 09 Escape-B Control-I

C) Prompts and Responses

This table summarizes the prompts, the functions that cause them, and the type of response EMAX expects.

EMAX is prompting for a number. Used in the set-fill-column function.

? EMAX requires confirmation to proceed with a potentially destructive function. 'Y' proceeds; anything else cancels. Use by kill-buffer and quit.

: EMAX is prompting for a search string, or the replacement string of the query-replace function. Enter the string, terminated by RETURN or any control character. If a null string is terminated by RETURN, a null string is used; if a null string is terminated by a control character, the string entered the last time is re-used. This works for query-replace as well as searches. Quoted characters (preceded by control-Q) can be used in search and query-replace. RETURN must be quoted; but be aware: the echo actually does a RETURN, so it won't look right as you enter the string; and a RETURN used in a query-replace works properly, but the screen is not painted right. Do a redraw.

Note: All searches are case insensitive.

number A count is being entered, an ESCAPE followed by one or more digits. When you are done entering the number, just type the command key(s); do not terminate with a RETURN. (That would insert that number of RETURNs.)
Note: The number is modulo-65,536.

I EMAX is prompting for the buffer name to insert, following the insert-buffer command. A-N inserts that buffer, anything else cancels the command. It will not insert the current buffer into itself.

The rest prompt for filenames. They prompt a letter, an '>', then the default drive/directory. In the descriptions, the default is assumed to be 'D1:'. Unless otherwise specified, a null response cancels the command.

D>D1: Directory search string. Null response uses '*.*'.
F>D1: File name for loading into a buffer. find-file command.
G>D1: Change device and/or directory and/or subdirectory default. If the response contains a ':', the old string is replaced; otherwise, the response is appended.
L>D1: File name to lock. lock-file command.
M>D1: Subdirectory name to create. make-subdirectory command.
N>D1: OLDNAME,NEWNAME. rename-file command.
R>D1: Name of binary file to load and run. run-binary command.

U>D1: File name to unlock. unlock-file command.
W>D1: [New] filename to store the current buffer under. write-to-filename command.
X>D1: Filename to delete. delete-file command. Wildcards work.

D) Limits

Due to Atari memory limits, small limits have been applied as follows:

Search/replace: These buffers have a 31-character limit.

Keyboard macro: 126 characters.

Default directory string: 53 characters. NOTE: This is NOT enforced. Although the 53 maximum is enforced on a single input command, since the default can be added to incrementally, it could otherwise grow to well past 53. Note: 53 characters is what was allocated on the title bar, so the rule is, if it is properly displayed, it is OK.

Filenames: 12 characters - 8 for the name, 3 for the extension, 1 for the '.'

5) Bugs, features, and other notes/hints

A) To speed up typing, a tradeoff was made that might look like a bug. When inserting and deleting single characters, EMAX must reprint any characters to the right of the editing. (The XEP80 has character insert and delete primitives, but they don't work for tabs.) To prevent loss of typed characters, EMAX tests for any new characters typed while in the process of this reprinting. If any are typed, it just stops printing, in the expectation that future reprinting will fix the display. This generally works, but occasionally you may end up with a few nonexistant characters off to the right. Just do a control-X control-A.

B) The Atari uses software to debounce the keyboard. The routine does not time properly when I/O is going on, and the effect of this with the behavior of EMAX is that the second of a double letter can be lost when inserting near the beginning of a long text line.

C) During debug my XEP80 would seem to suddenly malfunction. It looks like I got all the bugs, but if it happens, the screen suddenly will get trashed. Use the reset-xep80 function (ctl-X ctl-R) to restore control. This does not re-issue user initialization commands; it is intended to give you a chance to make a clean exit and reload.

D) Many functions take enough time that input characters can be lost. I tried the typeahead buffer routine I saw in one of the mags a few years ago, but anything like this exhibits the double-letter phenomenon mentioned above, only worse; and also has compatibility problems.

E) In order to use special printer functions, I use escape sequences mixed in with my text. Not elegant, but hey.

Try it. If you have trouble, or comments on the prog or docs, drop me a line.

That's it. I think it's a sequal. There is also Scraper Caper on cartridge. I want the BIN cartridge file to run on Rainbow. I have the bin.cartridge file of Miner2049er which runs on the Rainbow emulator for PC and Mac.
I also have the bountybobstrikesback.exe for Rainbow but don't know how to run it.

Cb> Right, FTE bought Newell out, I believe. And nobody, AFAIK,
Cb> can find FTE.

FTE (Fine Tooned Enginering) is out of business as far as I know.
I talked with Bob Puff just recently, and he said
that the warehouse of FTE was on fire once.
FTE had a lot of debts, so at one moment all the
stuff in the warehouse was auctioned off, and cleared.
Bob said that some people made some good deals then.
Can anyone confirm this? (i.e. making a good deal?).
FTE still had some stuff left though. But if he's
still working on his MARS-8 project I dunno.
Anyone has such a board btw?

Bo.

Some of my labels have had the expiration date on them, some haven't.

The final issue of my subscription came with a letter reminding me to renew.

Translators use up the ram under the OS, which spartados needs. There is
a special version that will run on an 800, but good luck finding it. I
had a copy once and have since lost the image.

> Anything that I could run that would give control to Sparta whenever I

> this? Am I doing something wrong?

If you want to use a file w/o the extension in spartados, you need to put
a '.' at the end of the filename, like: COOLGAME.

> I have also noticed that when using SIO2PC to play Alternate Reality, I
> see a "cracked/hacked by
> screen thingie. I don't see this in the Shareware APE distribution.
> Anybody know why? Just
> curious.

Are you using a .PRO image w/ APE? If so your running the real copy protected
version. If your using the same ATR images and getting different results
then thats unusual.

RESTORE

Most Infocom games used the similar SAVE/RESTORE commands, so this
should work for all of the Zorks.

So Jeff,

What your saying is I can take my Snappy (I own one, if your
referring to the Image grabbers, its a little grey/blue box that plugs
into the parallel port of a PC) and capture images on an 8-bit. I
definitely want that program!!!

The Translator disk turns your XL or XE into an 800, and the 800 can only
run Spartados version 1 or SDX (the other versions of Sparta use the top 16k
of RAM, which is where the Translator is loaded).

The APE version may have come from the actual author of Alternate Reality,
rather than from a hacker. I seem to recall that there is an AR home page
somewhere too.

Sorry to burst your bubble, Star Raiders 1 was an APX game, I have
it...

The Last Starfighter was written to coincide with the movie that Atari
wrote the Video Game for, shown constantly on WHAM and ENCORE the past
few weeks...

The Last Starfighter was NEVER released by ATARI, the movie BOMBED at
the box office, so they scrapped it....

They did a complete Rewrite and released it as Star Raiders II.

Play the 2 games... The LAst Starfighter is based on the movie, where
you destroy the attacking fleet, the great barrier, etc..

If I'm not mistaken, Star Raiders II no longer has the Barrier, you
have to land on planeets, etc. to get fuel, or dock at space
stations..

The LAst Starfighter is a BETTER game in my opinion, as you can orbit
the stars and regain your power, recharging your power cells, etc..
Star Raiders makes you rely on those space stations and once they are
destroyed, you're sunk....

US Code Title 47, Sec.227(a)(2)(B),a computer/modem/printer meets the definition of a
telephone fax machine. By Sec.227(b)(1)(C), it is unlawful to send any unsolicited
advertisement to such equipment. By Sec.227(b)(3)(C), a violation of the aforementioned
Section is punishable by action to recover actual monetary loss, or $1500, whichever is
greater, for each violation.

E-mailing me indicates acceptance of these terms.

> read out a relative x and y pos.

Hi Thomas,

you are right. You just need to connect a ST mouse to one of the joyports of the XL, preferably port 1, so port 0 is free for the joystick.

Here is what basically happens when you move the mouse:

The 4 bits of the joystick port value that normally tell if the stick is pressed left/right/up/down now change their values whenever the mouse is moved. 2 bits for l/r and 2 bits for u/d. The way they change tells you if the mouse currently is moved l or r. So what you need to do is check these bits very often and follow their changes. This can't be done in BASIC (which is far too slow). You need assembler or QUICK (which I know, too, because I'm one of the programmers) and probably a VBI.

Then when you detect a change you increase or decrease the x (or y) value of a variable AND now (or anytime later) you move the mouse pointer (which probably is a player/missile graphics, or perhaps just a cursor character) to its new position.

The left mouse button is directly connected to the trigger (like the one of the joystick). The right mouse button is, by chance, connected to one of the paddle inputs, so it is even possible to get the value of the right button, too.

Unfortunately it is a long time ago that I wrote the mouse driver for QUICK and SAM. So I don't know exactly which sequence of bit change is connected towhich movement. Perhaps I can look that up.

In any way, it is not that easy to do it: You need interrupts and player/missile graphcis.

Harald

> always too slow...

Just in PURE BASIC. Using a Vertical Blank Interrupt it works very fast
- just like on a ST and with less "stop and go" than on a PC ;-)

With the interrupt your main program (in whatever language written) does
not need
to poll.

> 2) Solution two is a combined hardware/software solution. Connect the mouse
> to an external piece of hardware that provides the necessary position counters
> and use a little software that reads these pointers in the VBI and fills, for

Nice idea - but really only necessary for "not-ST-mice" or BASIC
programs without
background assembler driver I would say.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

hello,

i've written an win95 frontend for XL-it!, mainly for the use
of long filename diskimages. (like they r on yogi's site)

u can get it at

http://stud1.tuwien.ac.at/~e9326116/atari

(btw, does anybody know what happend to the xl-it! site?)

another thing:

i'm just planning an database (accessable through the web)
of all atari8bit games. (e.g. name/company/release year/ranking...)
anyone interrested/ got ideas about it? mail me.

//Atti Atlan

> read out a relative x and y pos.

you are right. You just need to connect a ST mouse to one of the joyports of the XL, preferably port 1, so port 0 is free for the joystick.

The 4 bits of the joystick port value that normally tell if the stick is pressed left/right/up/down now change their values whenever the mouse is moved. 2 bits for l/r and 2 bits for u/d. The way they change tells you if the mouse currently is moved l or r. So what you need to do is check these bits very often and follow their changes. This can't be done in BASIC (which is far too slow). You need assembler or QUICK (which I know, too, because I'm one of the programmers) and probably a VBI.

The one I wrote originally used one of the timer interrupts. When I added it to a graphics mode program I was doing, all was still fine until I started using DLIs. There is some kind of interaction between DLIs and timer interrupts which I think causes some of the DLIs to get lost. This might be OK normally, but in my program it caused a slight screen flicker (because when a DLI is lost, whatever you're going to do with the display doesn't happen). I tried to switch to using the VBI - except it is not frequent enough. A fast mouse movement would overrun and would result in slow movement of the cursor. So I sprinkled DLIs throughout the display (I think 4 of them did it) and used those to read the mouse.

I think some of the versions of my mouse drivers are on archives - I posted them here maybe 4 or 5 years ago. They used the Commodore mouse, but it might be OK. I think they worked with the Atari trackball also.

My driver maintained X/Y coords in page 6 somewhere. I think you could also set limits on how far the driver would let the coords travel.

> what some with tell you is my position), then you should know that
> both sections now have new opening pages detailing my position.
> I invite you to visit, and get a dose of the truth.

OK, I thought I would humour him. I'll present the 'truth' according
to Novak below, from his web page. Fair Use applies, I believe.

The first thing I'm greeted with is the following:

>Jason, Donald J. and Kathy J. Artman -- PLEASE read this as well!
>The truth about Paul D. Smith -- PLEASE read this as well!
>The truth about some of the jerks on the Usenet newsgroup
> rec.games.video.classic (RGVC) -- PLEASE read this as well!
>The worst run ISP's on the Internet? -- PLEASE read this as well!

Four (count 'em!) links to his personal hate pages. Let's go down them
one at a time, 'K?

ooooOOOOooh. He has a /jerks/ directory now!

http://www.io.com/~vga2000/jerks/artman.txt

>...Not to mention all the time
>involved in this whole mess (remember, time is money).

>I did some research and found out which newsgroups Jason posts to
>(hence the cross-posting of this message), and I also discovered that
>Jason has run a few auctions before

>Jason also has a web site, from which he trades Led Zepplin related
>items. I won't give the URL at this time (I don't want to increase
>his traffic).

>Don also runs a computer networking consulting business from the same
>postal address. Its called:

So, it seems that first, Novak was complaining that he wasted loads of
time with this whole ordeal, and he was pissed because of it. No prob,
I can see that. However, when I continued to read, things got
'intresting'. Specifically, he spent much more time researching
exactly what the guy was into, what his parents did, where they worked,
etc. etc. Seems to me that would take much more time than a simple
call to a bank. Must be NovakLogic(tm).

Onto:

http://www.io.com/~vga2000/jerks/rgvcjrks.htm

>This section will contain information on those individuals who, for
>whatever reason, decided to lie about me, attack me, and/or threaten me
>on RGVC (and in some cases e-mail based on RGVC posts). It should be
>noted that my policy towards others, at all times, is to be polite and
>respectful to them (and thankfully, most people are the same way).

Lesse... I guess this mild flame will be called an 'attack' on you,
so I hope to garner a page in your 'Hall of Flame', so as to speak.
I don't have to dredge up posts where you incited flamewars; AFAIK you
have started just about every Novakian flamewar in here. Check out the
'Novak FAQ' for evidence of this.

>That stops, however, when someone decides to start spreading lies about
>me, attacking me, and/or threatening me. I have NEVER initiated ANY such
>actions, on anyone. However, when others do so to me, thats when the
>gloves come off.

I'm not spreading lies (all this info is gleaned directly from you),
I'm not attacking you (If I were I would be cursing, etc),
and I'm not threatening you (Do you see me say I will call the 'net
cops on you?)

So, by your own text on your web page you should treat me the same as
I treat you.... and if you can make up a flame like this directed towards
me for my posts / web page, by all means have at it.

And, to get to the last point, you *have* initiated flamewars here in
the 'group! See the Novak FAQ.

>Now, I am NOT telling you that you shouldn't deal with these people.
>I'll just let you know what they have done to me, and you can judge for
>yourself if they are the kind of people that you want to deal with.

And I hope to let people know how you treat others that you perceive
as a threat (be it real or imagined). What stares me in the face
in day-glo colours is this: "If this deal with Novak will go the least

bit south, I shall see my name plastered with nasty remarks all over
his web page and Usenet." *that* will be a place I sure would avoid
doing business with.

>The information provided here was ALL obtained by Internet sources >available
to anyone!

As was this information.

And finally,

http://www.io.com/~vga2000/jerks/jrk-isps.htm

Add in the *exact* same two paragraphs as above. (the 'policy' and
'gloves come off' ones)

>Now, I am NOT telling you that you shouldn't deal with these ISP's. I'll
>just let you know what they have done to me, and you can judge for >yourself
if they are the kind of people that you want to deal with.

Wheeee. Very creative. Replace people with 'ISPs' LOL! He forgot
to replace the second instance of 'people' with ISP. If'n ya gonna
do the cut'n'paste thing, at least get it raaaht.

>The information provided here was ALL obtained by Internet sources >available
to anyone!

C'n'P

As a side note to this... I have to wonder why his ISP canned him.
ISPs don't just can users. It's bad for business. I'm left wondering
exactly *why* he was canned. Could it be his little instruction
manual scam? Since I don't have the facts on this I will not speculate
any further.

Oh, *now* we get to 'Video Game Advantage'.

>After graduating, I decided to continue VGA, but as a full-time venture.
>This WWW site marks another milestone in the history of VGA. After being
>in business for over three years, with the establishment of this site
>(10/95), VGA has gone global. And with a 24 hour a day presence!

Is your businessname, etc. registered and do you pay taxes on it?
Sorry, but I've been meaning to ask. If the name is not registered,
there's nothing preventing someone from registering it and sending
a cease-and-decist order (of using the name). Just FYI.

>You can expect this site to grow and improve over time.
>Michael J. Novak Jr.

Indeed. There's been a blossoming of hate pages I've noticed.

And here's the much-debated game manual business:

>And to those who typed the manuals in; THANK YOU (there, I capitalized
>it)! I'm sure that we all appreciate the work that you put in...I know

>that I appreciate it.

Oh course your appreciate it. *you* didn't do any work, other than copying said manuals from other people's pages. I'm sure the people who typed these things in wouldn't have minded it too much if you kept their names intact as to who typed what in. I mean, your petty ego had to be boosted that little bit by replacing each name with your own.

...And what was I saying about egoes?

>I simply feel that it is more important for people to have access to the >files, in as close to the original content format as possible, than it is to feed egos. That is why I created the most comprehensive manual >archive on the WWW. That is why I spent so much time re-editing every >file.

If you truly meant that statement, this is what you would've done. You would've kept the original typer's name in, and maybe (just maybe) added your name in at the bottom. Not doing so is sorta like biting the hand that feeds you; i.e. you piss off the people who type the manuals in, they won't let anyone type in others! (i.e. if they own a rare manual or something) I got burned in a similar way. I read in a few carts and found people trading them when I specifically told them to distribute said images freely. Result? I will never read in another cart and give out the image... *ever*. (even if you own the cart, forgetit) Ditto for my Giant NES tech info file. Someone leaked it out (to 300 some people) and as a result, I'm not releasing the revised editions to anyone. According to Novak: "You don't own NES' technology, you just entered it! I can take it and do what I want, even though it took you hundreds of hours to generate it!" But I digress.

>I have also never claimed to have typed in these manuals. I re-edited >them, and cleaned them up. I put the last line in each file for two >reasons: 1) as an end of file marker, and 2) to let people know where >the files were stored (and who was paying for said storage). When I >begin putting manuals up that I have scanned in, I will denote which >ones they are (probably with a graphic next to the file name on the >link).

Oh, I get it now. If *you* scan/read in the manual, we get to know, but if others put in countless hours of work doing the job you won't let them be known. Greaaaaat. What was that about egoes again?

>If you would like to use some of the game manuals from this web site on >your own web site, well thats between you and the companies that own the >copyrights. All I ask is that:

>1) you store the files you want on your own system (ie, don't link >directly to my storage)!

Makes sense, this is exactly what you did. I should open my own manual archive, exactly like yours in every detail, except the last line of

each will be replaced by my own text. I wonder how ya'd feel about that one.

Checking Dejanews for some baseline posts:

>People like you have sooooooo much courage over the Internet. I'll
>tell you what, Jace, why don't you try saying that to my face, and
>we'll just see what happens, you GUTLESS JERK!

Aaaaaaah, the good old "If you were really here.... <ffft> <ffft>" flame. Seems words aren't good enough. (Why are words good enough one way, but not the other?)

>dinsdale@vegas.infi.net (Dinsdale Piranha) wrote:

>Thats about it.
>
>Michael

Let me quote from above.

>It should be
>noted that my policy towards others, at all times, is to be polite and
>respectful to them (and thankfully, most people are the same way).

Granted, he was involved in a flamewar at this time with Greg, but still this had *nothing* to do with said war.

>It is not a flame war Powell. I will stop defending myself when people
>stop attacking me.

And finally, seems he likes to post e-mail: (you can find these by searching Dejanews with the following topics)

Larry Scott Ii's e-mail harrassment [10/01/96, #3]
Christopher Daniello e-mail [9/30/96, #1]
Carl Nation latest e-mail [9/26, #1]
J.T. Sowers e-mail [9/28, #1]

So in closing, this will be my final word on the whole Novak dealie, unless matters make me post otherwise. I would drop him into my killfile, however since W95 doesn't have a decent newsreader, this is not an option. (I would use tin on my Shell account, however it is not installed, and will never be installed according to the sysadmin.) And besides, why would I deny myself the *fun* of watching him make an arse of himself?

Steven,

Hmmm, that brings up an old question of mine. What issue of Analog
contained Part II of the Arm Your Atari article? My Analog collection
is a bit sketchy from that time period and I always wanted to see part
II.

Rob

I don't suffer from insanity -- I enjoy every
minute of it!!!

When I was little I used to have a nice little game that I loved to play. But I did not know its name. I also don't know what happend to it, I guess I deleted it or something. Well the whole point of the game was to build a wall! Their was a belt on the top of the screen and it would drop down bicks. Your job was to catch the bircks and to throw them up and make a wall. Now if any one knows the name or knows where I can get it please E-Mail me!!! My E-Mail is PNY@WPORT.COM

1180. Help! MIO manual needed!

Newsgroup: comp.sys.atari.8bit

From: buck@grolen.com
Message-ID: <33f38aac.0@news.grolen.com>
Source record: 70900

I'm looking to buy a MIO but the seller has no manual. If anybody has
a copy just laying around that they are willing to part with or copy
for me I would be really grateful!

I have never recieved replies to my e-mails to F.T.E. so I'm assuming that
they don't support the MIO anymore and wouldn't mind if I uploaded a copy
to the archives on the net (assuming I can acquire a manual to type in).
If F.T.E. is still around and they do mind please let me know.

Thanx!

Got some 8-bit software that would be great, if only you knew the instructions? Are you stuck right at the end of a text adventure? This site might help. It is a collection of doc files that I have had on disk for years. I thought that they may be of use to others, so I built a web page where they can be accessed.

http://www.crestviewfl.com/~richard/atari-docs.htm

Let me know if it helps!

I just found an EXCELLENT Adventure clone for PC's. It's practically
a port! It runs in MSDOS text mode, has some useful features, and
can be ran with joystick or keyboard.

Check the "Adventure Home Page" for a link:

http://www.wwu.edu/~n9642587/adventure/adv.html

There's also an interview with Warren Robinett (the author)! :)

Just what I find snooping around Yahoo!

You can use TextPro.Shareware.

>Do you hace the LVAUG patch to Atariwriter? It makes AW+ Sparta
>compatible and usable from HD. I'm sure someone has a copy they
>>How do I exit to BASIC from Sparta? I believe BASIC ON just turns
>>it on internally.

The BASIC command switches the BASIC internal cartridge in & out of the CPU's
view ("address space").

You don't "EXIT" to BASIC,you run it.
Switching between DUP (or CP) and BASIC is like using the GOTO BASIC command.
You can't exit or "RETURN" back to where you were.

Use CAR.I think that "RUN A000" will also work (for BASIC).
But probably not for all cartridges.There's no universeal abosulute run
address.The run address is stored at the end of the cartridge.

>At the DOS prompt type CAR and hit enter. This will execute the
>cartridge (whatever cart is plugged in). If you are using BASIC
>>How about a SpartaDos friendly "TRANSLATOR"?

SpartaDOS X can load into normal or banked memory.So you COULD use that.
(but if it loads into normal 48k memory,there might not be enough room for the translator)
SpartaDOS 1.1 was made for the 800 and doesn't use the OS shadow RAM.
(not to be confused with the shadow hardware registers in the OS database)

>SD (except for SDX cart) is not compatible with the 800 since you
>need the RAM under the cart (at least 64KB of total RAM).

>>Anything that I could run that would give control to Sparta
>>whenever I press reset instead
>>of handing control back to the same program or coldstarting?

Well by default,the CP (command proccessor) or DUP DOES get control back after a RESET ("warm start").But if a programme re-programmes the DOS-init vector, there's little you can do short of using a hardware or OS ROM monitor/debugger to re-set the vector (called DOSINI).

(DOS sets DOSINI to run it-self so that it can re-allocate the memory that it is using,else after a RESET,BASIC would happily over-write DOS)

>>Is there a super copy program out there to run on the Atari that
>>will copy any of the
>>protected software images down to a floppy? And if there isn't,
>>how the heck did someone
>>create the image in the first place?

The Pro-System cable (for APE) will record a great deal of information about a disk so that copy protection can be emulated by APE.

>There have been many, but they usually require extra hardware. One
>is the BlackBox with the Super Archiver, another was the Ha

The BlackBox has nothing to do with copying copy-protected disks.
Of course it's monitor could be used to BREAK copy protection.
(true of any monitor interface)

>Commercial copying of protected disks use special equipment that

>know, since I never owned this game.

He means how do you load SAVED games,not the game it-self.

>>How do you move files in Sparta?
>There are two ways. 1) a seperate program called MOVE.COM which,
>unlike the MS-DOS version, simply moves the directory info fro

I'm sure that MS-DOS's MOVE just uses the re-name function to move the directory entries when moving a file to the same disk.
(MS-DOS doesn't let you open directories and copy dir-entries like SpartaDOS does)

>>I have noticed that when I copy Atari Dos 2.0/5/s binaries to
>>Sparta, I normally have to rename
>>the file with an .exe or some other extension before Sparta will

>>even find it. Anyway around
>>this? Am I doing something wrong?
>No. Sparta will only execute binary load programs if they have a .
>COM extension. You have to enter the entire filename.ext the

uh,what?

SpartaDOS only has COM files.There's no such thing as a EXE file on the Atari.
SpartaDOS X has a new binary load format that gives you re-locatable programmes
like MS-DOS's EXE files,but they're still called COM files.
(SDX also has a third format used by device handlers)

On the PC,COM files are just raw data with no format.The data is copied into
memory and a JSR ("GOSUB") is performed to the beginning of the data.
Since memory addresses can be "adjusted" so that any location can be memory
location 0,the COM file data can be put anywhere.
(on a 16-byte boundary)
OF course,since it's just raw,un-formatted data,there's no way for MS-DOS to
tell whether it's really a binary load file.So Atari COM files will crash
MS-DOS.
(MS-DOS doesn't handle "ilegal instruction" interupts.There's no such thing as
a ilegal instruction on the Atari(except blank memory))

MS-DOS has had EXE files from the start.
(when Microsoft bought it from Seatle Technologies)
They have a format,including a list of address references that MS-DOS must
change for the programme to run in the memory location that MS-DOS chooses for
it.But a mis-named Atari programme will still crash a PC,even if it's a EXE
file.(MS-DOS doesn't pay attention to the extention,aparently.Neither does
SpartaDOS,for that matter.Only the CPs care)

They allow you to have files that are re-locatable.This is useful if you want
to make a programme that's larger than 64k.But COM programmes can be big too
by splitting them up into 64k "chunks".
This is actually a better way since you could store these chunks in
bank-switched memory.(which all the modern PCs have)

(PC's have a 16-bit address space like the Atari.To access more than the 64k
of memory that MS-DOS loaded the programme into,programmes can alter special
registers.These registers control how much the addresses that the programme
use are offseted.Thus address 0 can refer to anywhere in the 1024kb of
memory,on a 16-byte boundary.Since changing the whole 64k of memory would
confuse a programme,there are several registers.One refers to the address
space that the current programme is running from,another to the adr-space that
contains the data that the programme is reading/writing from/to registers,and
one for the stack (a 64k stack!))

Of course this is all nothing compared to the way that you can hack memory
addresses with a 80386 equiped PC.(though MS-DOS doesn't support bank-switched
nor 80386 memory in the same way that The Atari OS doesn't provide a universal
way to access more than 64k of RAM)

>>I have also noticed that when using SIO2PC to play Alternate

Does anyone know if the game "Scraper Caper" really exist? It was suppose to have been the true sequel to Miner 2049'er. I have some old Big five ads that show it advertised coming right after Miner 2049'er.
Bounty Bob Strikes back supposedly came after this.

I have not seen or heard of anyone who has or even seems to know about this program.

Does anyone have it? Does anyone know what Bill Hogue (programmer for the bounty bob series) is doing today and if he has an E-mail address.

Nick

1186. Star Raiders for ST, tell me about it

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-15 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5t13oihfo1@nuke.csu.net>
Source record: 70904

I remember seeing a screenshot of "Star Raiders <something?>" for the
Atari ST long long ago in one of the Atari magazines handed down to me.

I remember rather squarish Zylon(?) baddies, and they looked a little
bubbly in that 3D way. Anyone wanna fill me in on the details of this
game, since I wish to one day become the ultimate receptical of all
Star Raiders information on the planet..?

Thanks! ;)

The Enforcer (tort@springnet1.com) wrote:

: Sorry to burst your bubble, Star Raiders 1 was an APX game, I have
: it...

Really...? It was released under the Atari name. It was coded by an
Atari dude (Doug Neubaer- the guy who did the POKEY chip).

<snip>
: The Last Starfighter was NEVER released by ATARI, the movie BOMBED at
: the box office, so they scrapped it....

Huh.. :) I kinda LIKED that movie! ;)

<snip>
: The LAst Starfighter is a BETTER game in my opinion, as you can orbit
: the stars and regain your power, recharging your power cells, etc..
: Star Raiders makes you rely on those space stations and once they are
: destroyed, you're sunk....

No... you can gain energy by orbiting stars. You'll die if you sit
around too long.

And personally, I think that Star Raiders (original) is the best game
of all 3. Sure, it doesn't have all the fancy-pants graphics which makes
SRII (and LSF) LOOK cool, but at least the 3D controls didn't suck! :)

It was pretty similar to the original although with much better graphics and sound, as you'd expect. They also didn't have as many "screens" to visit because of the better real estate on the monitor, so you had the galactic map right below the main viewer. The display didn't take up the whole screen either, there was a mask representing the "sides" of the ship with instruments on it.

It sucked. It was kinda funny, because it was _very_ similar and had much better graphics and sound. However the gameplay just wasn't there, and it grew boring after 1/2 an hour or so.

store this case in a safe place")

: who typed these things in wouldn't have minded it too much if you kept
: their names intact as to who typed what in. I mean, your petty ego had
: to be boosted that little bit by replacing each name with your own.

mike, why don't you just restore the original files and put them on the
pages instead of your edited ones? That would be very easy to do, y'know.

: >I simply feel that it is more important for people to have access to the
: >files, in as close to the original content format as possible, than it is to
: feed egos. That is why I created the most comprehensive manual

Replace "created" with "copied" and you'd have yourself a true statement.

: >archive on the WWW. That is why I spent so much time re-editing every
: >file.

Append "with my name instead of the original typist's" on that sentence
for another true statement.

1197. Re: Help! MIO manual needed!

If you get permission to post to the net I will be more than happy to
scan mine in, OCR it and post the resulting file.

In the meantime if you want to pay me for the copies and postage I do not
see the harm in making a copy of the manual for you.

-Marlin

Just a reminder! If you want to learn about Star Raiders, come check out my tribute page!

http://zippy.sonoma.edu/kendrick/star-raiders/

It has a little info. about the author, the features of the game, a few screenshots, a scan of the BEAUTIFUL cover art (unfortunately, my scan doesn't do it justice!), AND the COMPLETE manual! (In HTML! with scanned images!)

I hope to ONE day:

* get an interview with Doug... anyone got an e-mail address or phone number I can buzz? ;)

* get some Quicktimes or AVI's of some game play

* create some fan-art (I've already got a nicely rendered 3D quicktime I'd like to put up)

Come and visit; gimme some comments/suggestions while you're there! Thanks!

Erich,
That is correct and the instructions for building your own are posted
on his web site.
Mine tests OK according to the program, but I can't seem to communicate
with either of my XF551 drives or my 1050. I'll e-mail Darek to see what
he says then post his reply here.

Jeff!? :) Anyone!? Maybe I'll go upstairs, hold my breath, and
dig into my limited collection of Atari books and try and figure it
out myself...?

BTW, Jeff - Gamecenter.com had a "10 games that changed history" and they
mentioned MidiMaze... I bugged them about the fact that we have a
nearly identical game thanks to you and that one-of-a-kind cable. :)

I ALSO bugged them to mention Pong, Space War, Star Raiders, Adventure
and Bolo, though, too. :)

Internal data registers are 32-bit. Addresses are 32-bit, but only
the first 24 bits are used on the 68000. The external interface to
memory, etc is 16-bit.

Technically, it operates internally as a 32-bit processor, but talks
to the world at 16-bits. There was a huge thread spawned some time
ago in another programming newsgroup about how to define 16-bit vs
32-bit processors and the only thing that was agreed upon is that
everyone disagreed.

If you wan't me to read any response from you, do not respond here,
Direct all responses in E-Mail to: bensmith@teleport.com

The Bravo Sierra Web Page has been fixed. If you find trouble with my
Web Page, please E-Mail me at bensmith@teleport.com.

I've added more Items to my Catalogs, such as several large boxes full
of Atari ST Software. All of them Complete in Boxes with Documentation.
Some are still UNOPENED and SHRINKWRAPPED. As well as an Atari SM125
Mono Monitor with a Built in Monitor stand and an Atari Laser Printer.
For the Classic Atari 8 Bit Line Added Hardware was a U.S. Doubler Disk
Drive plus a modified 800xl with a built in Translator on a switch that
will run older Software without a Translator Disk Plus Lots more new
8 Bit Disk SoftWare for $5 each.

Following is only a partial list of what's in my Computer HardWare &
SoftWare Catalogs. Everything mentioned on this list is on this list
because I have multiples of these Items and I thought I'd list them for
you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got
HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers,
Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks & Under the
Monitor Power Directors to Manage & Protect your Equipment. And
Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore
CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives,
Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct
Connect Printer Interfaces. HardWare specifically for the Atari ST: SLM
804 Laser Printers, Spectre GCR Macintosh Emulators, Color & MonoChrome
Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes,
Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk
Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST
and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of
Antietam, Flight Simulator II and Scenery Disks,
Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space
Eggs, Space Journey Math Educational Software, Target Practice, Temple
of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons &
Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the
Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The
Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World
Championship Karate. Productivity Software for the Classic Atari 8 Bit:
Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak,
Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc.
Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy

Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

I have some MFM & RLL Hard Drives I got Directly from the Shadow of Shadow Software. Older Technology made with a lesser chance of Planned Obsolescence. Built like Tanks. The Shadow tells me each one worked before they were taken off their Computers. Each one, $25, as is. Model numbers follow...

Kalok KL320 MiniScribe 8425 SeaGate ST-238R SeaGate ST-225
Lapine Titan LT 300 RLL MiniScribe 3425 Conner CP-321
Seagate ST-157A

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I

don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

While the graphics were pretty good (nice cockpit), the gameplay on the ST version was horrible. It had none of the action and strategy of the original. All the subtle strategic elements that made the original such an amazing game to play were non existent in the ST version, along with terrible sound effects. I remember being very excited about this version when I got my ST back in 80'something. After about ten minutes of play I realized it was a dog.

1208. Game Link II device driver idea!

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5t3e9i$a5f$1@nuke.csu.net>
Source record: 70828

Hi - I've sent this message to a collection of people I know and who I consider a TAD bit more competent at programming the Atari than I am. ;) I've also put this on comp.sys.atari.8bit for anyone else out there with some time on their hands and assembly programming under their belt. I completely understand if you're too busy or not interested in helping.

I've whined NUMEROUS times for help programming for the Game Link II. (For those who don't know, it's an SIO device which connects up to 8 Atari 8-bits together. It was designed by DataQue Software and used in the AGDA Group's "Maze of Agdagon" (very similar to MidiMaze for the ST, it can be downloaded from the UMICH archive at: http://www.umich.edu/~archive/atari/8bit/Games/Action/agdav1c.arc) and at least one other game, a "Battle Ship" game that I can no longer find. The simplest Game Link II cable can be created with two SIO cables and one or two paperclips(!) and provides a two-machine connection.)

After spending a lot of last night with two of my 3 800XL's sitting idle connected to each other and my scratching my head over De Re Atari and Mapping The Atar, and wishing I had a copy of the Operating System Manual that De Re kept telling me to refer to, I decided what we PROBABLY need is a new device handler which will let programs talk to each other via Game Link II using OS calls.

Thinking about it right now, I figure it can be done a number of ways, and I'm not sure which is best. You tell me. :) To start off, I believe it should probably be done in concurrent I/O mode (like a modem ("R:") handler). If this is a stupid idea or impossible, tell me!

(1) Create a new device (say, "G:" for "Game Link", although that's taken for a special graphical printer driver, or perhaps "L:" for "link")

(2) Create a device driver that is compatible with the MUX "M:" driver. (MUX, or Multiplexer, is a cartridge-based Local Area Network system for the Atari created by CSS.) This might make the Game Link II a cheaper (but slower) alternative to MUX units (not to kill your sales, Bob ;^)). This will also obviously allow any Game Link II programs to run over MUX's and any (or many) MUX programs to run over GLII's.

(3) Create a device driver that is compatible with standard
"R:" modem handlers. This way, as with the MUX idea
above, games and programs could be created that run either
on GLII OR over a modem. (That'd be damned spiffy!)

As a side note, related to this idea, it'd be awesome if
whatever driver gets designed for this system could be
handled by one of the emulators. Imagine playing
Atari games over the Internet like this (ie, with "XL-It!")!

If you're sick of this mail, stop now! :) The next bit is
information extracted from the Game Link II instruction
manual from the Maze of AGDAgon archive...

From what I can tell of the manual (I may be reading this
cross-eyed), it looks like you connect the following pins
of the SIO cables to each other (in the simple paper-clip
version):

DGND (Data Ground) <--> DGND (Data Ground)
SID (Serial Data Input) <--> SOD (Serial Data Output)
SOD (Serial Data Output) <--> SID (Serial Data Input)

Looks easy, makes sense. Now how does one program for it
(easily)!? ;^)

Any tips, help, .COM files or anything else would be great!

Thanks a TON!

-bill!

1209. Question for everyone...

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: The Shadow <shadow01@aracnet.com>
Message-ID: <5t3j1q$j5f$1@spitting-spider.aracnet.com>
Source record: 70829

As some of you may already know, I have been contemplating getting the entire Shadow Software line of products up and available on the web.

No I have a question for everyone, and I want you to take a moment to think about this, and then send me a note in E-Mail with your answers. PLEASE, PLEASE, be honest in your response. If I do this, it is going to cost me a considerable amount of money, and if I am not going to see a return on my investment, then it would be rather foolish to continue in that way....

Question: How many times in the past year have you registered software and sent the author money?

Question: If I make all of this software available, and you use it, will you send me money, or will you just use it forever without registering it?

Question: Do you BobTerm? If so, did you send Bob Puff any money?

Question: What Shadow Software products have you used in the past, and did you purchase them through a store/user group, or download them?

Question: What type of software are you looking for? Titles?

Thanks for your time, I will consider both the volume of responses, and the actual answers in deciding my next move... I will let everyone know as soon as I decide.

The Shadow

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete
subscription or ordering information should be given, including prices.
```

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection.

Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*. If there is no copyright notice, software must be considered Freeware rather than in the Public Domain.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

I collect information for this list from wherever I can find it. While most updates to this list come from you, the user of the list, I'd like to recognize a few of my more prominent sources:
- Atari Classics, published by Bob Woolley
- New Atari User, published by Page 6 Publishing (Les and Sandy Ellingham)
- Classic Computing, published by the Historical Computer Society

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

From: davepat@total.net
Message-ID: <33f5ba72.0@news.total.net>
Source record: 70836

In an article dated 16 Aug 1997 05:36:50 GMT, someone named William Kendrick says...

>
>
>From what I can tell of the manual (I may be reading this
>cross-eyed), it looks like you connect the following pins
>of the SIO cables to each other (in the simple paper-clip
>version):
>
> DGND (Data Ground) <--> DGND (Data Ground)
> SID (Serial Data Input) <--> SOD (Serial Data Output)
> SOD (Serial Data Output) <--> SID (Serial Data Input)
>
>Looks easy, makes sense. Now how does one program for it
>(easily)!? ;^)
>
>Any tips, help, .COM files or anything else would be great!
>
>Thanks a TON!

The GL2 protocol ties up the bus and uses its own interrupt routines, rather than the stock SIO stuff. For info on the SIO bus, take a look at SIO2PC; Nick kennedy has (somewhere on an early .atr) info on how he tied together two Ataris via the serial port. Or, look at the Analog series on "Zucchini", which used SIO links to tie together 8-bits.

The hardware manual, along with the OS user guide and the 400/800 OS Source code, is available from BEST. The Rev 9 catalog listed it at $15 - a steal, and a must have for this kind of programming.

That's it. I think it's a sequal. There is also Scraper Caper on cartridge. I want the BIN cartridge file to run on Rainbow. I have the bin.cartridge file of Miner2049er which runs on the Rainbow emulator for PC and Mac.
I also have the bountybobstrikesback.exe for Rainbow but don't know how to run it.

1220. FS EX game system and printer

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: mlunde@geocities.com
Message-ID: <33f5eb92.888650@news.execpc.com>
Source record: 70840

I have a XE game sytem and An atari daisy wheel printer for sale.
I will include Atari writer (or what ever the word process is called)
on disk. Each one is complete and has original boxes. The XE game
system comes with joystick, light gun, Flight Sim 2 and bug hunt on
cart.

I do have a 1050 floppy drive. It was reconditioned and the spring on
the drive doesn't pop the disk out. It works though and you can pull
the disk out with your fingers. Maybe some wants this for parts? Or
for the power supply?

Later I will post the software on disk that I have. If anyone is
interested.

If you're interested please email me with an offer on any part of the
system.

>DLIs and timer interrupts which I think causes some of the DLIs to get
>lost.

I did a lot of studying regarding this problem, and there is indeed a quirk in the 6502 chip that can cause either IRQs or NMIs to be skipped. In one of my programs, I had to disable keyboard IRQs and read the hardware on VBI in order to maintain a completely stable display.

I posted some info about these interrupt problems awhile back, and if anyone's interested I can start another thread and post the info again. I think it's a disasterous albeit fascinating hardware bug in that I can't believe it existed for so long without people seeming to realize it was there, and I had an enormously difficult time convincing Atari that it was real. (and maybe never actually did). The final chapter, is that an Atari running with a 65816 chip does not exhibit those interrupt problems at all. I also wonder whether the bug was exclusive to Atari's 6502C, or related to the DMA ready line processing, or whether it exists in all 6502 chips.

John Harris Japanese translation of Microsoft slogan:
jharris@poboxes.com "If you don't know where you want to go,
we'll make sure you get taken."

1222. Atari 400 Questions

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: pbjurman@aol.com
Message-ID: <19970816204000.QAA21312@ladder02.news.aol.com>
Source record: 70842

I'm a brand new owner of an Atari 400 computer. However, I have some questions, if you could please answer:

1) How can I connect my Atari 400 to a cassette tape player? How do I get the cord for it?

2) Can I get a modem for my Atari 400? I assume it plugs into the side of the computer. I would love to be able to get online using my Atari 400.

3) Can a disk drive be connected, or is the cartridge slot the only way to load software?

Please e-mail me at pbjurman@aol.com - thanks!!

-Sam Hartmann

1223. ATARI Equipment still avialable MUST SELL!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: tort@springnet1.com
Message-ID: <33fe1706.6527506@news.springnet1.com>
Source record: 70843

ATARI Equipment, MUST SELL!!!

ATARI 400 Computer, 16K, with power supply, manual, and 2 joysticks, TV
connector, original cost $599.00, Joysticks $19.95 each, asking $50.00
or best offer. These SELL AT Video 61 for $49.95 used.

ATARI 1027 Letter Quality Printer, New in Box, with ink rollers,
manual, power supply, connecting cables, oil, original cost $399.95.
Also have a non-working 1027, can be fixed at any Atari service center,
both printers cost new $399.95 each, asking $100.00 for both of them.
Again, these sell, each $49.95 at Video 61.

ATARI 1050 Disk Drive, works with any Atari 8-bit computer, in very
good condition, like new, supports single and dual density modes,
includes power supply, original cost $179.95, asking $75.00. These
sell at Video 61 for $74.95, same price.

Data-Que Turbo-816 upgrade for Atari 8-bit, XL or XE series computers.
Upgrades and replaces the 6502C in the computer with the 16-bit 65C816
CPU, can use Atari OS, or the NEW Turbo-OS included. Speeds up
programs as much as 350% faster. The 65C816 processes 4 instructions
per clock cycle (Only the new P6, 80686 Intel chip does that, besides
this), as compared to the 6502 which processes one instruction per
clock cycle. Original cost $249.95. Includes T816 assembler $75.00,
Cross Developer for IBM $75.00, sevreal other Turbo 816 specific disks,
valued at $25.00 each. Asking $250.00 for the entire package. These
are not currently available anywhere else that I know of.

ATARI 800XL upgraded to 256K memory, will run most 130XE specific
programs, already wired for Turbo-816 installation, just need to
re-solder 3 jumpers, and plug in the Turbo-816 kit above. Original
cost $189.95 for the 800XL, $79.95 for the Upgrade kit, $65.00 for the
256K DRAMs, asking $125.00. Video 61 sells the USED 64K model for
$59.95.

Supra External 2400 Baud Modem, includes powewr supply, no manual,
Hayes Compatible, requires 850/P:R:/ATR8000, asking $30.00

MUST SELL, will consider any reasonable offers on this equipment.

Send orders to:

STARFLEET SOFTWARE Company
1037 West Leafland Avenue

Decatur, Illinois 62522-1537

Will consider trading for a trak AT-D4 double sided disk drive NEED
ONE
BADLY someone has to have one, or a trak double-sided slave drive.
MAKE OFFERS!!

As Per US Code, Title 47, Chapter 5, Subchapter II 227
Unsolicited commercial advertising is NOT Welcome here

US Code Title 47, Sec.227(a)(2)(B),a computer/modem/printer meets the definition of a telephone fax machine. By Sec.227(b)(1)(C), it is unlawful to send any unsolicited advertisement to such equipment. By Sec.227(b)(3)(C), a violation of the aforementioned Section is punishable by action to recover actual monetary loss, or $1500, whichever is greater, for each violation.

E-mailing me indicates acceptance of these terms.

1224. !!!DANGER!!!Re: ATARI Equipment still avialable MUST SELL!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: ronf1@ix.netcom.com
Message-ID: <871782418.420@dejanews.com>
Source record: 70844

!!!DANGER!!!

First off you can buy cheaper from reputable dealers like cdw, necx, or
try a www.pricewatch.com search.

The author of this post is Terry Ortman. A 36 year old, single guy,
still living with Mom & Dad, who tries to sell lots of "adult material"
and other equipment from Mom's house. He was banned by moderators of
FidoNet. He then moved to UseNet where he started over again. Do a
DejaNews search from about 6/96 where he explains "how business works"
which was why he took Kubo Akira's (cjms@vnet.com) money but wasn't going
to send him a refund or the $268 of equipment he purchased. Kubo
complained openly on UseNet about not getting delivery after months.
Terry "fined" him $250,000 and applied the money from his order to the
fine! No joke. He is one strange boy. It seems he collects your money,
THEN goes out and tries to buy the unit he sold you. If there is a
problem, it was the "supplier" who ripped you off" not him.

For additional information try:
*DejaNews (around 6/96)
*e-mail the listserver at scammers@pdsig.com
*http://www.dynweb.com/theblacklist

This has been a public service announcement.

Ron

1225. newbie needs help

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-16 00:00:00 UTC
From: blayd@acorn.net
Message-ID: <871768154B.37B4@cyberbeach.net>
Source record: 70845

I dug out my old 800XL to mess around with, but I can't seem to do much with it at the moment. Everything still works, my old programs still run and stuff, but I would like to get some new programs to play with.

Is there a way to use my PC to create Atari disks?? I want to be able to download disk images, binaries, etc. and write them to disk on my PC and then use those disks in my Atari. Without any cables if possible.

Is this possible?? If not could somebody please point me in the right direction??

Thanks in advance for any help.

The Big N is a site for everyone to see. You'll love it. It's
becoming the fastest growing site, and once seen, everyone falls in love
with it. Below are a few comments it's got.

"Wow! I just found your site, and I think it is one of the best! Trust
me, I've been around the web a time or two and rarely have I seen a site
so well laid out and packed with good info."
"the big n is one of my favorite sites on the net"
"Hey man, Your site is kinda cool! I found out about it from the
Nintendo newsgroup! It has a long list of games & very true
information."

Actually, I could go on and on. I've been rated the best in N64
newsletters. You'll love this site. Just try it out. You'll love it.

yes! There are many different programs availble. Look out for S.A.M, Black
Magic Composer. At this time, I try to programm a Mouse-Handler Device, so
that many new programm could use this amazing hardware...

Nope. Star Raiders (the original) was published by Atari in 1979 and
written by Doug Neubaer. APX (Atari Program Exchange) never had Star
Raiders as a title, it was more of a software distribution channel
for amateur (and some professional) programmers like Chris Crawford
with Eastern Front. They even used to sell the source code to that
game.

Read Michael Current's FAQ at http://www.faqs.org/faqs/atari-8-bit/faq/.
In the section called "What can I do with an 8-bit Atari?" he lists six
or eight databases. There is also a list or link to vendor's phone
numbers and addresses.

The large 1 meg ATR files on Jellystone appear to only go up to 9, while the index files list several more. The ATR files that go to the rest like games010.atr are all 0 byte and they have been that way for over a year. Does anyone have the rest of these files available in complete form? The large images are useful for me since I use an old 386 as a fileserver with SIO2PC.

>Any one else think it's sad or is it just me?

Well Postboy, you might know from other posts that I was a regular at Silica when you were a sat lad so this is a bit sad for an oldie like myself. Its very like those threads from people who remember playing Rescue on Fractulas, ie laced with great memories that will never be as good as the time it happened no matter how good the emulator...

Ah well, they were in financial dire straights so It was expected, that and the fact that they changed from a good old players shop into a "wannabe" PC World...

Shame as they had people from the eight bit world working for them, an old mate Noel Daniel (drop us a line Noel) who co-wrote Sidewinder (great little shooter) and ventured on his own with a very good Uridium clone, Thunderfox (?) worked for them in Tottenham Court road.

Silica were part of the good times for me, I was writing for Atari User at that point and having a great time playing some of the most playable games around and getting paid for it....

There will never be a Silica shop emulator so Its going to have to be just good memories for those that used to know the shop....

Silica R.I.P.....

Paul `Mclane` Irvine

Well, upon turning on my computer, it goes into the Atari Note Pad instead
of a Ready prompt, and it appears like you can't use that command in the
Note Pad. Do you need the BASIC cartridge, or what? Thanks.

======================
Posting this as a favor
======================

ATTENTION ALL ATARI USERS!

From the former Prez of NWPAC,
Dale F. Wooster in Phoenix Arizona, August 13, 1997

I just got this card in the mail from Brad at Best
Electronics and wanted to pass it along to all you
old Atari 8-bitters and ST users still out there.

=====================================================

THE LONG RUMORED CATALOG IS REALLY DONE!

After 36+ Months of Intense Labor our Over Due Baby/
Rev. 10 Best Electronics All ATARI Parts/Reference
Catalog has Arrived. This New Rev. 10 version Catalog/
Atari Reference Manual is Over 4 Times the size of our
last catalog (June 1991) and has Many Interesting New Features!

Just to Tickle your interest here are just some of the Features:
* A Catalog Index. Easy to find Item/Product format
* 55+ Best Technical/Repair Tips covering ST, 8 Bit and 2600
5200/7800 Atari Products.
* 90+ Best Informative Information Tips.
* Over 330+ Pictures of Atari products (last catalog had 137 pictures)
* Over 2000+ New Atari part Numbers/ Products
* Expanded Listing and Descriptions of 8 bit Software Titles.
* An Atari Memorabilia Picture Museum and Complete Atari 1/0 Connector
* Specifications on just about every Atari product made!

As we start an Unprecedented 15th Year in the Atari Computer Parts
business, Our New fully Computerized Accounting System has had all of the
BUGS worked out, so each customer will Now have a Unique Customer Number for
easy Item Inquiries, Order Processing and Invoicing. We can efficiently
Track our 4,000+ Line Item Inventory!

The Unique Best Catalog which is Now Shipped World Wide to Atari end users
and Dealers alike is priced at $7.50 (Actual Cost to Produce only) PLUS
$3.00 U.S. Priority Mailing.

(California residents must add your local 7.25% (.54), 7.375% (.55), 7.50%
(.56), 7.75% (.58), 8.25% (.62) or 8.50% (.64) cents sales tax to the total.
```

So if you would like to get a hold of a Hot off the press copy of our catalog, just send us your NAME & ADDRESS and a check for $10.50 OR have us include the new catalog FOR $7.50 in your next Mail Order and SAVE $3.00.

Not a total waste of time, but I think it ironic that I have to have a
fully 'roided out 200Mhz or better PC to get the best emulation
possible. Even if I have a fast PC to emulate the slow 8-bit, it
going to crash or run imperfectly with the coolest demos and games.
I'm aware of the laptop angle but I think I can content myself with
using my 130XE at home with SIO2PC.

You have to use an Atari cassette recorder. It has a cord that fits
the 400 (or it may have a 13-pin socket liket the one on the 400).
Back in the early 80's Popular Electronics published a circuit that
would work with a regular audio cassette recorder, but today it isn't
worth the trouble even if you could find the article and all the
parts.

>2) Can I get a modem for my Atari 400? I assume it plugs into the side of

>3) Can a disk drive be connected, or is the cartridge slot the only way to
>load software?

You can connect an Atari disk drive or modem to the 400, but you won't be able
to do much with only 16K of memory. Keep searching the flea markets and thrift
stores until you find an 800 or any XL or XE model except the 600XL. (The
600XL also has 16K. It can be easily upgraded, or used for spare parts).

Message-ID: <01bcab5c$b3093fc0$874445d1@mkusz>
Source record: 70780

Answers:

1) The 410 Cassette recorder has a cord attached to it that hooks into the
Atari 400 computer.

2) Several modems will work w/o additional hardware. The Atari 1030
connects to the i/o port.
MPP has a modem that connects to the joystick port.

3) Disk drives are connected thru the i/o port. Software can be loaded
from cartridges, disks or
cassettes.

Hope this helps.

Really? The Atari 1030 uses the 13-pin port (2 rows, 6 and 7 pins)
directly?

Tired of visiting the same old Atari 8-bit links, over and over again?
Visit http://closertohome.dyn.ml.org/a8links.html . There are 96, count
'em, 96 Atari 8-bit related links on this page!

Oh, and sorry that CTH was down for a couple of days. Everything's fine,
and we're back up.

1250. Atari 800XL System Wanted!

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-17 00:00:00 UTC
From: henryolery@aol.com
Message-ID: <19970817235501.TAA13053@ladder01.news.aol.com>
Source record: 70783

I am looking for an Atari 800XL with power supply, TV hookup, working modem & disk drive. Also, I would be needing a good terminal program on diskette to use in the disk drive. I will pay cash for this, but I would Rather trade you all this for it:

Working Atari 400 computer w/all cables, power supply, and full-stroke keyboard, good condition
Two Atari joysticks

Working Atari 5200 game system with power supply and TV cables (no controllers), with 11 games:
Berzerk
Soccer
Football
Pengo
Moon Patrol
Qix
Kangaroo
Kaboom!
Defender
Pac-Man (2)

If you are interested in trading, or you would like to trade but would like to change some of the items, let me know - I'm flexible. You can write to me at henryolery@aol.com - thanks!

> But it's a nice CHEAP solution.(I got my PC/AT for $17,with 40MB drive)

I can think of a few reasons:
1. It's fun.
2. Seeing a modern computer brought to it's knees emulating in software
1979 hardware technology gives one renewed respect for what Jay Miner
accomplished on the 8-bits.
3. I can carry all my old Atari files and software (carts included) in my
shirt pocket on a Zip disk and use them anywhere I have access to a
computer that can run the emulator.
4. Emulators can run on a laptop computer, so you can play Star Raiders at
15,000 feet.
5. You can get very nice screen snapshots (almost impossible with the real
thing).

Granted, nothing runs those old games and other software like the real
iron, but emulators have their uses. Besides, it's not like you have to
use only one or the other.

Mark

1252. FS: 64K ATR 8000 plus extras, $30

From: chambera@cs.pdx.edu
Message-ID: <5t8hfk$ek3@deneb.cs.pdx.edu>
Source record: 70785

I have an ATR 8000 with the 64K CP/M option (the extra memory also works as a printer buffer). It's a bit beat up but works fine. Includes a photocopy of the manual, also printer and floppy drive cables. Asking $30 plus $5-10 shipping depending where you are (I'm in Oregon, zip code 97202). For a couple extra bucks to cover the additional shipping I'll throw in a pair of 360K floppy drives and an old XT clone case and power supply to put them in. It's cheaper than two XF551's!

From: dklugh@iwaynet.net
Message-ID: <5t6jmd$8o9$3@triglav.iwaynet.net>
Source record: 70788

I never really understood why anyone would use a emulator.

If you have enough money to buy a computer fast enough to run even the fast PC Xformer,why not just go out and buy a Atari and SIO2PC cable?

Then you can have full graphics and sounds and real joysticks.

You can download the APE software and get UltraSpeed speeds.
While the baud rate is only 8% faster than a US Doubler drive,it acts as if you're using a track buffer.
Of course it may seem kind've slow compared to high-end drives which can reach 70000+ baud.
(USDoubler=53200,APE=57600 on reads)
And downright pathetic compared to PBI floppy and fixed drives.
(The KARIN MAXI floppy drive gets 11.25k a second,a IDE fixed drive gets 40k+)

But it's a nice CHEAP solution.(I got my PC/AT for $17,with 40MB drive)

1. Emulation makes a truly portable A8 possible (by using a notebook PC, of course.)

2. Emulation makes it possible for a guy with limited space to return to his beloved A8 without having to set one up (presumably with a shoehorn :-))

3. Emulation shows off the programming prowess of the emulator's author. Somebody, I forget who, once showed that a CPU has to be about ten times the speed of the CPU it's trying to emulate. Add in the difficulties of trying to emulate custom chips, etc., and you have one heck of a programming task. Seems to me, some emulators come awfully close.

4. Emulation is one component, and an important one, in an effort to save the community.

I agree that a real A8 will do the job better, and that SIO2PC and/or A. P. E. can help. But I think emulation is far from a waste of time.

From: nwdirect@netcom.com
Message-ID: <33F78A3D.3520@netcom.com>
Source record: 70797

It is hard to know where to start. I put my Atari 400 into storage in 1983. I remember a little about how it works but not enough to know what to do with it so I can play games on it again. This is almost like starting from scratch since it has been so long so please be patient.

I have the Basic cartridge but cannot find any of the others. I used to have a Program Recorder but that seems to be gone too.

I have about 6 games on standard cassette tapes which I am sure I loaded into the Atari with the Program Recorder. Is it possible to load these using a standard cassette recorder using the 13-pin port? What commands do I use to load them? What pins? Is a working program recorder available anywhere?

Please reply in this newsgroup. Thanks for whatever help you can give.

I remember the info you posted about this. I'm wondering if this is also
what causes that nasty flicker on a C-64 when you try to do a raster
interrupt (trying to simulate DLI's). Of course I've never seen any bit of
documentation on programming an Atari that told you to write to a register
twice in case the first time didn't take. ;-)

Those files are really for PC emulators.You can't use them on the Atari.
Your only hope is that your ISP has a copy of unzip that you can use.
Even then,to download a ATR/XFD file,you need a disk drive that has a higher
capacity than the ATR/XFD file is.For instance,most files are for 90k drives.
So you'd need a 130k or better drive (like a 1050).There are a very few 130k
images.If you can get them unziped,and download them via Xmodem checksum
(not CRC!),you can use a direct Xmodem-to-disk converter.But I forget where to
get it (D'OH!).Try the Merit archive.(look in the FAQ)

>three I bought all costed me less then $10 (I even paid slightly
>over $1 once :)). And that's all with PS and a tape recorder.

It depends on how much you want it.I love my old favourites like
Getaway,Xagon,Draconus,Zybex and so forth.I'd probably buy it since I have a
power supply,and my current 800XLs are a bit old and worn.

Plus it's just plain easier to use than a PC.
(though if you look hard enough you can find some nice programmes for the PC)

>No chance. It's an old 8-bit system from the eighties.

And 16-bit with the upgrade.

>> Also, does anyone have specs for the system? What is the
>>difference between this and the ST?
>The Atari ST is the younger (less-older) brother of the 800XL.

Actually the ST has nothing to do with the Atari (Home Computer System).
Atari was taken over by Tramiel when the ST came out,so it's barely the same
company.As I remember,he's the same bastard that ruined the Commodore.
(handshaked serial bus (it's based on a parallel bus design) and all)
I find the ST quite anoying my self.Yet another klunky interface from Atari.
It's actually worse than DOS's DUP!
At least there you could just type in the filename.With GEM you have to move a
arrow around (slowly) to a file name.You'd think that the arrow would simply
leap from filename to filename,but no.It smoothly travels across the screen.
At least a boot menu like many game-booters have could've been included.
And wildcards? Aparently Tramiel hadn't heard of those.
Forget about something as simple as "D*.TXT/N" to delete all text files.
You'll have to wander around taging each text file with the slow cursor.
But I could grouse all day about the ST.Let's go on...

>> Is there a version of Wizard of Wor that will run on this system?
>Yes. Maybe it's even available for download at Yogi's archive.

It's available at his ftp.hackerz.com site.You need to use "double-quotes" to
type in a file/dir-name with spaces.
It's in the very first Mega-Images ZIP.

>>How about the rpg Towers?
>Dunno about that.

huh?

>> I know that is a lot of questions, but I don't want to plunk down
>>nearly $20 for it if it isn't a good system, especially
>>considering that I'd have to track down a power supply for it
>>somewhere. (it has a strange connector that looks like a keyboard

It looks like a monitor connector to me.But all my computers have built-in keyboards.

>Well, it's quite easy to build a new PS yourself. As for it being a
>good system, I'd say yes, but what would you expect in an Atari
>8-bit newsgroup. :)

I really wish you wouldn't refer to it as "8-bit".When you say "8-bit" to a IBMer,they hear "worthless".

Then again,they upload PC programmes to the ACEC (Columbus) BBS since the file sections refer to "8-bit" files,and they think that the PC and PC/XT are 8-bit computers.

Plus there ARE 16-bit Ataris.And asemblers for them.

Whilst reading the rubbish I usually find here, Postboy wrote something interesting about Silica Shop Sidcup Closes!!!,

Hello Postboy,

>I parked in Sidcuptoday (UK) and saw that Silica Shop had closed down.

They went into receivership some months back, now.

>A very sad day as this was the main place for the 8 bit in the 80s.

I bought both my original 800, and later, my 130XE from them. I also bought other hardware form them.

>Any one else think it's sad or is it just me?

When it came to the crunch, (8-bits fading) Silica dropped the A-8's pretty damned quick. I recall that they refused to sell a couple of games for the Atari (L'il Devils was one, IIRC), on moral grounds. At the same time, they were selling the same games for other platforms.

In summary; No, I don't think it's sad.

How much RAM?,

Hello PBjurman,

>How do you find out how much RAM your Atari 400 computer has? I can tell

At the READY prompt, type ? FRE(0) A number will be printed to the screen.
Divide by 1024 to convert to kilobytes. That's the amount of *free* RAM
your system has. The easiest thing after that is to round up to the nearest
16k. As standard, I think the 400 only had 16k RAM.

>mine is one of the newer ones, for instead of a membrane keyboard, it has
>the full stroke keyboard like the 800 (yet is still a 400). Is there a

AFAIK, the 400 never had a fullstroke keyboard fitted as standard. There
were, however, at least two third party kits to fit one.

Message-ID: <2061.7168T516T500@pianosa.demon.co.uk>
Source record: 70874

Whilst reading the rubbish I usually find here, PBjurman wrote something interesting about Atari 400 Questions,

Hello PBjurman,

>1) How can I connect my Atari 400 to a cassette tape player? How do I get

You can't connect a standard cassette deck to the 400 (or any A8 for that matter). Well, not directly, at any rate. I vaguely recall that someone once sold an i/f kit to do this. I don't know who it was, or how good it was, though.

>the cord for it?

The Atari datacorders (410, etc.) all had the relevant cable/connector fitted

>2) Can I get a modem for my Atari 400? I assume it plugs into the side of

There was once a dircet connect modem for the Atari. In this day and age, they'd be pretty hard to come by, I expect. They would also be *very* slow by contemporary standards.

>the computer. I would love to be able to get online using my Atari 400.

The best advice is get hold of an Atari 850 interface, or P:R:Connection. These plug into the SIO port of your Atari, and allow you to use standard serial (RS232) peripherals.

>3) Can a disk drive be connected, or is the cartridge slot the only way to

Yes. In fact, it's a must, insofar as that most software these days comes on floppies. You'll be after an Atari 1050, XF551, or any of several third party devices. The 1050 was a single sided drive, and the XF551 double sided.

>load software?

Software ccan be loaded from cassette, disk, hard disk (but you need even more hardware to connect one), or cart.

If you're serious about boosting your A8's performance, keep your eyes open in this ng; There's lots of people selling gear in here. Also, look in thrift stores in your area. Many of the regulars in here have found some real bargains that way. It's a shame that computers don't turn up in those places on this side of the Atlantic. Well, not often, at any rate.

> Someone mailed me about me saying that the atari was the fastest computer
> except for the PC.

They were wrong, although it was the fastest 6502 based computer
available. It ran at just under 2MHz, whereas most other 6502 based
machines (Acorn, Apple II, C64, PET) all ran at just under 1MHz.

The Z80 based CPM machines were contemporary, and ran around 4MHz,
although they were primarily found in businesses and were nowhere as
widespread as the 6502 based machines.

> I can't even stand the XEs.What a idiotic idea those were.
> (membrane keyboard and all)

The XE did not have a membrane keyboard. It's clear you don't know what
you are attempting to talk about.

I believe the Missle Command cart has a Trackball mode in it. I think
pressing the J and T keys change modes (big time guessing here). It's
been years since I tried. (Doesn't Millipede also have a trackball
mode?)

Otherwise, with a basic program you can just print out stick()
values. The values won't make too much sense, but if you roll the
ball slowly in only one direction at a time you should recognize a
pattern.

Looking for a little change in your game play on your 2600, 7800 or Atari 8-bit computer?

Call B&C Atari Sales & Service, they have a good sized quantity of the Atari 7800 european styled controllers, these look like Nintendo NES and Sega Master System type controllers, with a small micro-joystick, firing buttons in a small light easy to hold rectangular shaped controller case. They are a very nice addition to your Atari collection and they make game play a lot more enjoyable compared to the 7800 pro-controllers.

Also if your looking for power supplies, games and other accessories for your Atari video games, the newest Jaguar games and parts, software and accessories for your 8-bit or ST computer, gives these people a call, they've got it all!!!

1286. Bill Wilkinson's Game Link II suggestions

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-18 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5tadld$4sc$1@nuke.csu.net>
Source record: 70732

I bugged Bill Wilkinson (Compute! mag. columnist, all around cool Atari guy) about the Game Link II and here's what he says:

Bill W. Wrote, in response to my e-mail:

Hard to believe you're still at the same place.

Harder to believe you're still trying to get mileage out of the 8-bitters.

Strangely enough, my father-in-law returned an 800 and an 800xl to me, so I **could** run software on them again. But that was a year ago and I haven't even opened the boxes yet. Ditto on the ST my father returned to me. Sigh. No time. Too interested in what I'm doing now. (Check out http://www.supercede.com to see what I've been working on for four years.)

Anyway...

Digging back into my memory...

I can see how it would be easy enough to hook up a pair of 8bitters via SIO. But how do you handle the potential conflicts with more than a pair? Do you designate one as the master and have it poll the others? If not, what's to prevent two machines from sending at the same time and thus hosing each other?

I suppose you could set it up as a ring. Machine 1 sends to 2 which forwards to 3 (adding its own packets) which ...to 8 which forwards to 1. Each machine forwards all packets received, stripping out only the ones it originally sent. (In fact, this is neat, as NOT receiving your own packet means something went wrong somewhere in the circle.) Since each machine is sending to only one other and listening to only one other, there would never be any contention issues. Hmmm...I think I like that...

Now about the software: If you use a packet based system on top of that hardware solution, then you would need a pretty smart driver, by Atari standards. And you couldn't run anything else on the SIO bus at the same time, I would imagine. Which means you could probably ignore all the Atari SIO standards and just treat the SIO bus as your own

private serial network. Simplifies the job tremendously.

So all you really need are:

1) Asynchronous packet reception
Put any received packets into analysis queue.
2) Packet analysis:
a) if from "me", verify that this packet is at
top of verification queue. If not, we have a
packet order error. If so, kill packet from all queues.
b) else, put packet info into game input queue
and ALSO put packet into transmission queue
3) Asynchronous packet transmission
a) Simply sends next packet in queue.
b) If sent packet was from "me", put it in
verification queue; else delete packet.
c) If no more packets in queue, go to sleep.
(Use VBI to test for new packets and wake
up transmitter again, if needed.)

I would imagine you could probably survive with fixed size queues;
either 128 or 256 entries. If you want to get sophisiticated, set it
up so trying to add to a full queue blocks until something removes
an entry from queue. Put in a timeout so game software failure
won't keep everything blocked forever.

For real simplicity, use fixed size messages. That way you can
use a pool of message space instead of having to allocate dynamically.

(Geez, this is so different from what we do in our work, where we don't
worry about tossing away a megabyte in buffer space if it will speed
things up!)

As for hooking this up as a device driver: Yes. Why not. You send
a packet (message) to "L:" and receive one from "L:". The queueing
and buffering is all transparent to the game, per se. (As is the
packet verification.)

Note that this works for ANY number of machines. Not just 2 or 3 or
8. Theoretically, you could hook up 100 machines and have it work.
(Of course, at SIO speeds, it might take a minute per turn then...)

Lesseee...19200 baud, roughly, is 1920 bytes per second, probably
half that by the time you throw in message bounds, etc. Say 800
bytes per second throughput. Divide that by average size of message
(8 bytes? depends on game, I suppose) and get total messages
per second (100?) and then figure out how many messages per second
you need to make game playable (10?) and you get max players
(10? in this example?).

But a game like Battleship probably really could support 100 players.

What you think?

Ignoring the original poster and his inflated price tags...

Who has one of these upgrades installed?

How well does it work?

Does it introduce any kind of incompatabilites with existing software?
Or with other hardware upgrades/alternate OSs? Would it just be
better to stuff one in a stock 800XL and not deal with other
memory/hardware hacks?

Is this upgrade really not available anymore?

And put it where? Store all the floppy disks where? Put the TV/monitor
where?

The reason you use them is because you already have the desk space
reserved for your "real" computer, and every game written for the A8 will
typically take up less than 1/4 of the average shipping hard drive.

1307. Re: Emulators:Why bother?

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-18 00:00:00 UTC
From: "David G. Dahlstrom" <ddahl@tiac.net>
Message-ID: <5tb22c$m6f@news-central.tiac.net>
Source record: 70815

Here's why we bother.

Not all of us think of emulation as simply emulation. We think of it as a kind of extension of the operating system that allows software designed for another platform to be run on our computers. Sure, the hardware has some nostalgic value, but it's the classic software that most of us are really interested in. The beauty of emulation is that these great old titles can no longer die since they're no longer tied to hardware. This is especially true when emulators are written in portable code. Emulator technology is steadily improving and will eventually become nearly perfect (in fact, emulators for some other systems are just about 100 percent now). And, of course, you can't beat the convenience of having an entire Atari computer system and software collection in just a tiny corner of your hard drive.

Hi..
I own an Atari 800 and 800xl. I have many games for them. I just recently got an emulator for my PC. I'd like to be able to play the old games, such as Donkey Kong & Pac-Man, through my emulator. However, I can't find a site that has these old roms or disk images. Can anybody help me? Please reply to Turbo1970@aol.com. I use that address for e-mail purposes. Thank you...

I sure laughed out loud when I read that bit of the C64 doco. It's been
awhile, but my guess is that the C64 hardware is quirkier than the
interrupt bug, and the most likely cause of its screen glitches. Skipping
interrupts is generally pretty rare until you do lots of them.

: 400, and I'm interested in getting the Atari 1030 modem (have no disk
: drive) and using the Atari 400 to access a local BBS. Is Telelink a good
: program? Thanks for the info in advance!

Not knowing your situation, please avoid flaming this suggestion. :)

(1) Get a 130XE or, preferably, a RAM-upgraded XL (nicer keyboards)
(2) Get a disk drive (1050 probably)
(3) Get a better modem. At the VERY VERY least an SX212 (1200bps).
Anything higher and I think you have to go the P:R:Connection or
Atari 850 RS232-interface route.
(4) Get Ice-T and/or FlickerTerm.

This is ESPECAILLY if the BBS is heavy on ANSI/VT and 80 columns.

Good luck!!!!

1313. NEW GAME - GemDrop

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-18 00:00:00 UTC
From: kendrick@zippy.sonoma.edu
Message-ID: <5t906s$470$4@nuke.csu.net>
Source record: 70821

I was at the arcade for a bit last night (hey! they had Tekken 3! cool! :))
and I saw some NeoGeo game called "Lucky Drop II". It seems like an
extremely simple idea, so I've began coding it for the Atari!

Don't worry, I still plan to finish AsterBlast, but unfortunately I'm
hitting a lot of roadblocks. :^((Honestly, I'd rather write it in
assembly, but I don't KNOW 6502 assembly! <:^[ )

Anyway, the game idea, as I said, is a fairly simple concept.
You're a dude at the bottom of the screen. At the top are a lot of
colored things (doesn't matter what they are). You can take one of
the things from the collection and hold it. In fact, you can hold more
than one of the same color. While you're playing, every once in a while,
a new row of objects pops up at the top, pushing the rest down a row.
The object is to get rid of all of the objects before the screen fills
up and you get squished.

It's similar to Bust-A-Move, actually, minus the angled shooting,
and the fact that you get your objects by pulling them off the screen
(not out of a bag). When you throw your collection of objects (in
my version, gems, of course), if you hit one of the same color, they
all disappear. If you hit one of a different color, they stick.

In fact, when I was looking at this game, I said to myself "looks like
Bust-A-Move, plays more like Klax."

ANYWAY, so I've began coding it in Action! I'm going to do the
graphics tomorrow if I have time. I'm going to bug someone about
doing CMC music for me (you know who you are :)), and I'll eventually
recode some of the primitives to handle the graphics better.
(Right now, I'm literally PrintD(6)'ing onto a Graphics(2) screen!
Hey! It works! All I cared about was getting the GAME engine done,
not being efficient or looking good! :))

The current specs of the game are:

* One player DONE
* 10 levels (quick useless game, a la Tetris) DONE
* 5 songs (hopefully! :)) NOT DONE
* Specials (bombs, game freezers, etc.) NOT DONE
* Nice gfx (maybe 8 or 16 colors in med-rez?) NOT DONE
* Sega Ctrl (optional, of course; auto-detected) DONE

Hey, looks like I'm half done! ;)

Expect this game out within probably a week or two, which is more than
can be said for Aster Blast! :) (Anyone want to help?)

I think the biggest problem with programming the 64's VIC-II chip was that
every 8 scan lines you ended up with a "bad line" with fewer cycles. I
think it was when the VIC gave control of the bus back to the 6510. Very
strange stuff in there. ANTIC & company just seem so much easier to play
with.

Al,
I agree with you 100%

DKlugh,
I happen to have a fully functional 103XE with MI/O at home, but I
can't have it at work. I use PCXf 3.60 at work for some stuff. I don't
think emulators are a waste at all. At least I can run some of my useful
8-bit stuff that I have created in BASIC XL.

> The Z80 based CPM machines were contemporary, and ran around 4MHz,
>although they were primarily found in businesses and were nowhere as
>widespread as the 6502 based machines.

BUT!!! The code efficiency of the 6502 (and the later 65C02) is
very great. I found that the 65C02 would beat the 8088 by about
6 to 1.

It is very easy to complie code for the Z80. But the 6502
requires human assembly language coding. A 65C02, EVEN
TODAY, is a very competitive processor. (and I hate Mensch)

Robert,
To connect a (up to 7) hard drive to the 800XL, you'll need one of two external interface units. The Black Box from CSS or an ICD MI/O. The BB is better and covers more drives, but doesn't have an internal ram disk. No biggie though. The BB have many more features and add-ons and works best with My-DOS, but is good with Sparta too. You'll also need a SCSI<>MFM controller, like the Adaptec 4000A also available from CSS. I haven't tried BeWeeDOS yet, but have heard good things about it. I personally use SpartaDOS X 4.20 cart on my 130XE and SpartaDOS 3.3 for my emulator (PCXf 3.60). SDX works great with my 256K MI/O and 10MB HD. Hope this helps.

BTW, CSS (Bob Puff) is at:

News to me, but I thought that it was only the Z-80 portion of the C128
that did this? Still, the 128 was much later than the 400/800 series, so
I would hesitate to call it "contemporary".

> I registered it a while back. The sound in 1.4 is pretty good.

Does digitized voice work? I hear this is a common problem. Does the
vertical smooth scrolling work well? The Mac interface really bites, but
it does seem to do the job.

> thing I'm really looking for now is for Chris Lam to add support for large
> disk images, so that it will be possible to avoid keeping gazillions of

Large disk images? What is this? I think another cool idea would be to
gzip to the emulator, so you could gzip the images, and then have the
emulator decode them when loading into a temp file.

I posted an Atari 1400XL for sale about two weeks about on comp.sys.atari.st. The highest bid I received was $120. I put the sale on hold because UPS was on strike. The strike has ended! I will be selling this computer next week to the highest bidder. Buyer pays shipping and I will ship UPS - COD.

The 1400XL was the upgrade to the 800XL that was never shipped. Atari only made a few lab machines. It has a built in modem and voice. The case looks like a 1200XL. After the "T" family took over Atari, the 1400/1450 design was scrapped and the 65 and 130 took their places. If you have any questions just ask.

1329. FS: 815 double disk drive

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-19 00:00:00 UTC
From: apalmer@zapcom.net
Message-ID: <5tch42$2vf$2@ultra.sonic.net>
Source record: 70749

I posted this 815 for sale about two weeks ago on comp.sys.atari.st.
The highest bid I have is $120. I put the sale on hold because of the
UPS strike. The strike is over! Buyer pays shipping and I will ship
UPS - COD.

The 815 disk drive was never sold because of manufacturing problems.
Many people did place deposits for the drives in 1980 and 1981. I think
this hurt Atari and helped prevent the 8bit from becoming a business
system in the early 80s. The 815 is a double drive - double density
disk drive. The format is non-standard. If I remember correctly,
Percom set the standard for double density and double sided drives for
the Atari 8bit. If you have any questions about this drive, just ask.

1330. Atari - the beginning of everything

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-19 00:00:00 UTC
From: Lukasz Urbaniak <lurban@sgh.waw.pl>
Message-ID: <Pine.GSO.3.96.970819182617.17752B-100000@akson>

I mean the beginning of my computer activities.
About 10 years ago I had Atari 65XE with tape-recorder. What a powerful machine it was!!! Then, it seemed to be the greatest computer all over the world (at least from my point of view- especially that I'm from Poland). Me and my brother learnt our basic informatic knowledge by using that stuff. And we spent a lot of time on programming in Atari Basic and also on squeezing our joysticks.
If there are still any Atari-8-bit users I'm greeting them very hot!
Luke

The game "The Last Starfighter" was written by Atari based on the movie of the same title. Back in my BBS days when I ran a BBS I received a pirated copy of this software. The game is complete with opening title and while playing it I even found an easter egg as well. Atari Corp (better known as El Cheapo Corp) didn't want to pay royalties out to I believe it was Orion Pictures who produced the movie that the game was based on, so they ripped out the whole opening sequence (Welcome Starfighter! You have been chosen by the Star League to defend the Frontier against Zir and the Kodan Armada) and placed a title screen which looks like a 4 year old did it in 5 minutes showing STAR RAIDERS II which has nothing to do with the original story line of Star Raiders.

It would run at 1 or 2 MHz in 128 mode. In 64 emulation it would only run at 1 MHz though I think there are ways to hack around that.

The C128 was contemporary with the XE models. I was in the market to upgrade from my VIC-20 at the time and ended up buying an 800XL instead of a 128---or a 130XE--- for a variety of reasons. (I couldn't afford an Amiga, I could get an 800XL with a 1050 for about the price of a bare 128, I'd just read Buchholz' article on upgrading the XL, I had used a friend's 800 and was very impressed with the graphics, etc etc)

I guess I'm just destined to make trouble...

The real reason the "Shadow" wants to know these things is that he's
afraid he's not going to get a return on his investment. That is, the
money he spent buying the rights to certain software titles just might
not pay off if he goes with his "fairware" concept. Certain posts of
mine may have gotten him thinking.

The truth is, "Shadow" probably doesn't have a leg to stand on, should anyone infringe on his copyright claims.

These are the same legal questions that killed Atari as an 8-bit powerhouse. As a moneymaker, the Atari was, is and forever will be, a bad idea.

But it's still the greatest computer ever produced. Go figure.

Steven

P.S. "Shadow" has a name, and I know it. I just wish he would use it.

Get he files of BW-DOS 1.30 (or 1.10). It's almost compatible to SD 3.2 and includes a description of the commands. But don't care about the internal/external command description - it's different organiced than SD 3.2. It needs no RAM below the operating System and does support Atari DOS 2.5 disks only via a seperate Menu progam.

Hi Rob,

You'll need to get a PBI interface for your 800XL, Supra used to make an interface for MFM hard drives a while back, your better off tracking down an ICD MIO or a CSS Black Box, they are easier to find and they have SCSI, Parallel, and Serial interface. You can pick up 20 & 40 meg SCSI drives for $20-$30 these days and they'll probably be a heck of a lot more reliable then some old MFM hard drive and yes SpartaDOS does support 16MB partitions on hard disks.

: do I use to load them? What pins? Is a working program recorder available
: anywhere?

: Please reply in this newsgroup. Thanks for whatever help you can give.

The cassettes you have may have deteriorated to an unreadable condition
over 14 years. Also program recorders can be cantankerous beasts.
Unfortunately, a standard audio cassette machine won't work with your
computer. An Atari program recorder has special circuitry that reads
FSK signals from tape and sends data to the computer. If you want to try
to find a replacement, I believe the model 410 is of better quality
than the newer 1010 (don't know about the newest XC12). You might be able
to find either type for sale here -- keep checking this group. Or read
Michael Current's Atari 8-bit FAQs at
http://www.faqs.org/faqs/atari-8-bit/faq/. It'll have a vendor's list
where Atari 8-bit items are sold. At least one vendor, B&C
ComputerVisions has a web page. It's at http://www.myatari.com. Their
catalog is available on-line for Atari 8-bit computers and other Atari
systems.

Commands to load programs from a program recorder? From the BASIC "Ready"
prompt, type CLOAD and press Return. The computer should beep once.
Press the PLAY button on the program recorder (the tape must be cued to
the start of the program). Press Return again. The tape should begin to
run and load (with silence at first, then with beeping sounds). If you
get an error message, try again with the tape more carefully positioned at
the start of the silent portion. When the Ready prompt returns, type RUN
and Return.

If the program on the tape is in machine language (a so called "load and
go" program), cue the tape to the beginning of the program. Press PLAY.
Turn off the computer and remove the cartridge. Hold the START key while
turning the computer on. It should beep once. Release START and hit

Return. The program should load and run.

As for Atari 400 computers, they're good for playing games. And this post was prepared on one and sent through my internet provider via Lynx.

> Thanks,
> Louis

Louis,
Check at ftp://atari.archive.umich.edu/atari/8bit/ .there should be at
least one that will work. If not. I have a very basic BASIC communications
program that you can use to connect and communicate. It has NO file transfer
capabilities at all.
As for the 850 interface, it is a unit that connects to the SIO port of
the computer and provides serial and printer ports. The serial port is used
to connect a modem for communications. Max speed is 9600bps with the 850.
If you need any other assistance you can e-mail me at one of the
addresses below.

I have a 1200XL and love it, but I do need to make room here at the old homestead, so before I part with mine, I have a few questions...

1) Aside from the parallel bus, the sharper video and the built-in BASIC, how is my 800XL different?

2) I have heard that the 800XL is not 100% backward-compatible and requires the same translator disk that the XE family uses.

3) My 1200XL is just cool, is the 800XL better?

I am currently using the 800XL (I have two dead 800XLs for parts, one of the fully socketed) and have had no problems, but I was told to hang on to my 1200XL because of a compatibilty factor. If this is not true, then the 1200XL can go.

Thanks,
Louis

1350. Printer question:

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-20 00:00:00 UTC
From: almazzei@aol.com
Message-ID: <19970820133801.JAA10056@ladder02.news.aol.com>
Source record: 70678

In my box of miscellaneous Atari hardware sits an odd cable with an Atari peripheral connector on one end, and a Centronics parallel on the other. My question is this: Is it THAT easy to hook up a modern printer to my 8-bitter, or is that just somebody's "Easy way out" of buying an adapter of some kind with a voltage regulator and driver disk of some kind? Help! Because if it's that easy to just plug in any parallel printer, wouldn't it be kinda cool to hook up a cheap ink jet and see what the output of an Atari REALLY looks like? Cool...

Thanks,
Louis

Hello -

For you who do not speak German, our friend here is looking for a program called Cubase Version 2.0. His original disks are no more! Send a copy to the email address below. Note that version 3.0 does not work on his 1040.

Greetings!

RNeubert wrote in article <01bcac8f$2a450b40$3d0101c6@rneubert>...

Yeh,the Atari steering wheels and trackballs are speed intensive.
Something that simply reported the relative possition 60 times a second would
be nice.I think that the PC trackballs do this.
(the possition is sent serially)

>(I think 4 of them did it) and used those to read the mouse.
>I think some of the versions of my mouse drivers are on archives - I
>posted them here maybe 4 or 5 years ago. They used the Commodore

The problem with page $6 is that EVERYONE wants to use it.You should also
assemble a version that loads up at the top of memory.And perhaps one for the
tape drive buffer.(I have a CX85 handler that does that)

oops,I mean that I was saying that they were the fastest computer and the
mailer was corecting me.

>They were wrong, although it was the fastest 6502 based computer
>available. It ran at just under 2MHz, whereas most other 6502 based

It ran at around 1.79,which is half of speed of the colour clock.
So you can easily make routines that change colour dynamicly
(read "the time that the TV is drawing the picture")
by counting the number of cycles that commands take up.

>machines (Acorn, Apple II, C64, PET) all ran at just under 1MHz.
>The Z80 based CPM machines were contemporary, and ran around 4MHz,
>although they were primarily found in businesses and were nowhere as
>widespread as the 6502 based machines.

There was a whole big argument about the Spectrum (Z80) vs. the Commodore (8502
* 6510,I think) about the Spectrum's speed versus the Commodore's game-based
graphics capability.I really meant personal computers that individuals bought,
not mainframes and CP/M systems across the World.
Of course the Z80 machines usually had primitive graphics capabilities,so they
weren't really 4 times faster than Ataris and Commodores.
(certainly faster than a 1mhz Apple,though the Z80 is much different
than a 6502.You really can't compare them by speed since they have different
capabilities,and different operations take different ammounts of cycles)
And the Atari's OS allos you to read/write more than one character/record of
data per OS call.(c.f. Commodore's 1 byte ALWAYS I/O)

>> I can't even stand the XEs.What a idiotic idea those were.
>> (membrane keyboard and all)
>The XE did not have a membrane keyboard. It's clear you don't know
>what you are attempting to talk about.

uh,what a queer thing to say.I am most definitly attempting and suceeding
in talking about it.

If you've ever had a 130XE keyboard malfunction,and opened the case to fix it,
you'd see that the keys aren't even attached to anything.They are just resting
on two membranes of plastic with circuit tracings (painted?) on them.
I had to use conductive paint to fix it.

This may be slightly off-topic. But it is along the same lines. There was a joystick network once, described in a file at ftp://closertohome.dyn.ml.org/ftp/pub/Atari_8bit/New/utility/jnet.arc . It has the .m65 source code in the arc file. Here is an excerpt from that doc file:

My software/hardware uses one of the PIA pins in each joystick port as a dedicated output to the other machine's trigger pin, and configures the other three pins as either input or output depending on the direction of data transfer. This implies that only three bits at a time can be transferred, so the software has the responsibility of dismantling and re-assembling each byte for transfer. The trigger lines are used to indicate the sending and receiving of each chunk of data.

Maybe something like that would be good to use?

>to poll.

I don't know if 50/60 times a second would work.It's really up to how fast the
user moves the trackball.

>> 2) Solution two is a combined hardware/software solution. Connect
>>the mouse to an external piece of hardware that provides the

>programs without
>background assembler driver I would say.

Or make a adapter for the game(misnomer) ports to let you use a PC trackball.
You'd have to change voltages to RS232 +/-12V as well as swap wires.
You'd need to read individual bits (that is,to "emulate" the baud rate) instead
of whole bytes like SIO.But it's only 1200 baud.

Here's a message from comp.sys.os.msdos (or something like that).
It describes the two different trackball types (I prefer "MouseSystems") as
well as something called "LogiTech" that I've never heard of.

Message begins:

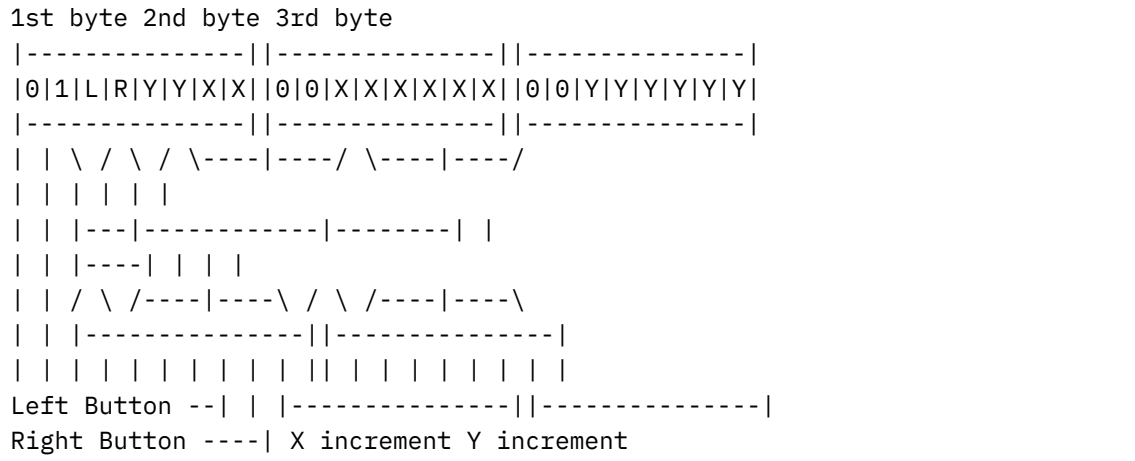
Hello,
I wrote a mouse driver, which supports Microsoft, Mouse Systems and
MouseMan (newer Logitech) protocols. However, I missed some docs, and
I write a program which captures the bytes sent by the mouse, and
after analyzing I finally got a quite good docs about these
protocols.
Here they are, in case someone needs them:

Mouse reset:

Set UART to 'broken line' state (set bit 6 of the LCR) and clear the
bits 0-1 of the MCR; wait a while and reverse the bits again.

==
Microsoft mode: 1200 bps, 7 data bits, 1 stop bit, no parity

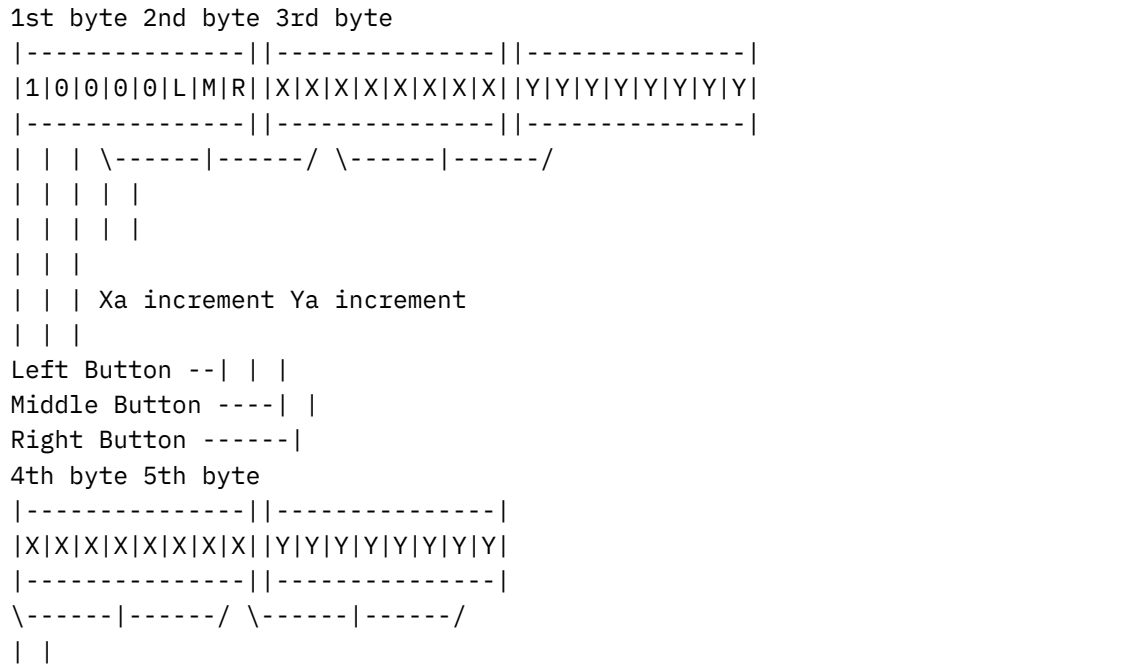


The X and Y increment values are in 2's compliment signed char format.

Whenever RTS is set to '0' and reset to '1', the mouse performs an
internal reset and sends the character 'M' to signal its presence.

==========

Mouse Systems mode: 1200 bps, 8 data bits, 1 stop bit, no parity



Note that the mouse systems mouse sends two independent bytes for
each direction in each packet!

Xa0-7 movement of the mouse in the X direction since last packet (+ right)
Ya0-7 movement of the mouse in the Y direction since last packet (+ up)
Xb0-7 movement of the mouse in the X direction since Xa
Yb0-7 movement of the mouse in the Y direction since Ya

```
================================================================================
MouseMan mode: 1200 bps, 7 data bits, 1 stop bit, no parity

3 bytes (left or right button pressed):
---------------------------------------

1st byte 2nd byte 3rd byte
|---------------||---------------||---------------|
|0|1|L|R|Y|Y|X|X||0|0|X|X|X|X|X|X||0|0|Y|Y|Y|Y|Y|Y|
|---------------||---------------||---------------|
| | \ / \ / \----|----/ \----|----/
| | | | | |
| | |---|------------|--------| |
| | |----| | | |
| | / \ /----|----\ / \ /----|----\
| | |---------------||---------------|
| | | | | | | | | || | | | | | | |
Left Button --| | |---------------||---------------|
Right Button ----| X increment Y increment

The extra byte (when middle button pressed):
--------------------------------------------

4th byte
|---------------|
|0|0|M|0|0|0|0|0|
|---------------|
|
Middle button

Logitech mice sends 'M3' after dropping and raising RTS.

---------------------------------

The driver I've written eats only about 7300 bytes! Not bad at all,
because for example the genius driver eats 25k, and doesn't support
Logitech mice.
The driver will be soon available on SimTel under the name 'ctmouse'.

Regards,

NagyD

Not really.They just added on.It DOES look like someone hacked Star Raiders 2.
(which diapointed me,when I bought it for $25 new)

>Play the 2 games... The LAst Starfighter is based on the movie,
>where you destroy the attacking fleet, the great barrier, etc..
>If I'm not mistaken, Star Raiders II no longer has the Barrier, you
>have to land on planeets, etc. to get fuel, or dock at space
>stations..

You also don't constantly move over a planet's surface in Last StarFighter.

>The LAst Starfighter is a BETTER game in my opinion, as you can
>orbit the stars and regain your power, recharging your power cells,
>etc.. Star Raiders makes you rely on those space stations and once
>they are destroyed, you're sunk....

You can orbit a star in Star Raiders 2.But you have to leave once you're
re-fueled or else you melt.(there is a delay between being full and melting)

But the original Star Raiders was the best.The others were really just
eye-candy.They weren't space simulators,just arcade games.

It also did not have steering through hyperspace. It was not possible
to destroy your own starbases to prevent the Zylons from using them
for raw fighter material. One could not use the hyperwarp engines for
quick but energy inefficient limping.

It looked great in the graphics department but they didn't implement a
lot of the GAMEPLAY that made Star Raiders such a great game. It was
only a harbinger of what was to come......arcades packed full of
stupid fighting games and eyecandy games with little gameplay such as
Starblade (could only shoot enemy ships and ammo...no resource
management and could only fly prearranged course to prearranged
obstacles.).

Yes, there were a few new (and very useful) instructions added,
but the real reason that Franklin used the 65C02 version was
power consumption in battery operated devices. The 65C02
is a CMOS version.

Hello everyone...
This is the first time i can acces the comp.sys.atari.8bit. Looks pretty interesting at this place. I read lotsa mail from here, but never had the possibility to reply or send messages in here...
But I can now. Happy to see 8-bit is still alive on internet also !

Sysop Fox-1, Thunderdome, Atari 8-Bit BBS, the Netherlands. Running Pro! 5.0b, supporting XL/XE, 2600/5200/7800, Jaguar64, Lynx, XL/XE-Emulation, a little of ST/TT. Networking with the Netherlands, USA, Canada, Germany, & the comp.sys.atari.8bit.

(Still looking for running Pro!-BBS' in England to network. Anyone ?)

Gateway: THUNDERDOME, Atari 8-bit BBS. Running on ATARI 130XE. (Pro-node 471)

> how is my 800XL different?

Your 1200XL has an unusual OS that will make it incompatible w/ some
XL/XE software.

> 2) I have heard that the 800XL is not 100% backward-compatible and
> requires the same translator disk that the XE family uses.

The 64/128K XL/XE series all can use the translators, in the same way.

> 3) My 1200XL is just cool, is the 800XL better?

If you put an 800XL os into your 1200XL its better imho since the keyboard
is awsome, and there is tons of room for mods. Do a clearpic and a PBI
expansion, and youve got a dream machine.

Unix users note that hackerz.com does not support recursive directory gets (ala ncftp, etc...). So, it makes it very hard to keep an up to date snapshot. However, you can get "mirror" and force it to do a cd/ls for the entire tree.

Are there some good unix tools to work with atr/xfd files? I want to reallly convert all of these back to native atari format and burn them on a disc. (My use ONLY).

Heck, I'm only running it on an ancient 66mhz powermac and it works quite well. Yep, some games play too slowly, but most work fine. Let's me play Alternate Reality again in any case. :-)

If you get a 1030, the communication software is built into the modem.
All you need is the modem and computer. The s/w loads from the modem
when you power up. Works good, but you can't download. No drive,
whatdoyoucare?

Yeah, and when you add a Black Box or MIO to it, you can suddenly
hook up gigabyts disk drives and CD-ROM drives for amazing power.

The Pam and Tommy Sex Tape also comes with 1 MB of RAM if you decide
that 48K or 64K just isn't enough in your 800 or XL/XE computer...

You do know that these were never released and that the prototypes that exist are expensive? (Well, expensive by Atari standards...measured in the hundreds, probably.)

What about Ataris being mentiond in the lyrics:

Here's the fourth verse of Rebel MC's "Better World" (ca. 1990).

Now you're listening, so hear me
What I'm saying is a peice of reality
I'll keep going they won't stop me
Wait as I reset the ATARI
Save the world from nuclear destruction
We've got to keep it for the next generation
Understand help your brother man
We can make it work yes we can
It's a dream I'm going to chase
Make this world a better palce

I played a 3D game where you had to bounce a ball.It could use a ST
mouse/trackball.Forget the name,though.
The ST joystick port seems pretty similar to the Atari's.
(The Amiga's was exactly the same.Even supported paddles)

>joystick.

Not that I wouldn't mind games that support the ST's flight simulator joystick
and stuff like that,but shouldn't game support the Atari trackball over the ST
one? (or both)

>Here is what basically happens when you move the mouse:
>The 4 bits of the joystick port value that normally tell if the
>stick is pressed left/right/up/down now change their values
>whenever the mouse is moved. 2 bits for l/r and 2 bits for u/d. The
>way they change tells you if the mouse currently is moved l or r.
>So what you need to do is check these bits very often and follow

Then again,the ST trackball description that you just gave sounds simialar to
how it works on the Atari.But it's been too long.ARE they the same?

>their changes. This can't be done in BASIC (which is far too slow).
>You need assembler or QUICK (which I know, too, because I'm one of
>the programmers) and probably a VBI.

Nor should it.It should probably be done in a handler or USR() routine loaded
from a file.That way you don't tie your programme to a particular device.
So someone with a FlightSim multi-button joystick could also use your
game or drawing programme.
(It should probably be a handler.That way,it starts it's interupt-driven stuff
when you open it,and stops automaticly when you close it.(like R:)
(The "DOS" and "END" BASIC commands automaticly close all but channel#0)
So you don't end up with situations like on the PC where games exit

enexpectedly,and leave the sound card making (FM) noise.But that's just anoying,leaving interupts running on the Atari could be fatal.Of course the beauty of the Atari is you can just press RESET to fix up the interupts.No RESET button on the PC.I use the "TSR set of utilities to re-set the interupts)

Well maybe not the beginning of everything, but I think the Atari computers
were the first fun computers. Before the Atari, you needed to be a geek
who enjoyed playing games with ugly graphics & sound like the kind you got
on Apple II, Commodore Pet and TRS-80.

Fernando

>>the computer. I would love to be able to get online using my
>Atari 400.

But Atari programmes are much smaller.So it wouldn't seem that slow compared to
the PC.You'll get either 30 or 120 bytes per second.
(though the SX212 (at 1200bps) doesn't come with a in-built handler.so if you
don't have a disk drive to load a disk-file handler with,it's useless.The
300baud modems have a handler built in.You can actually boot off of them.And
the 1030,at least,also had a terminal programme inside it)

>The best advice is get hold of an Atari 850 interface, or

>days comes on floppies. You'll be after an Atari 1050, XF551, or
>any of several third party devices. The 1050 was a single sided
>drive, and the XF551 double sided.

But the XF551,acording to Bob Puff,has problems.Of course everyone knows that
you can't format the back of a disk.
(the only way to get full storage is to use it's double-sided capability)
But it also doesn't report the "sector not found" error corectly.This means
games that look for that error will see some other error and not run.
And it's also anoying for those of us who actually want to know what's going
on.Though I guess PCers are used to getting vague,meaningless errors.

>>load software?
>Software ccan be loaded from cassette, disk, hard disk (but you
>need even more hardware to connect one), or cart.

Well,it usually doesn't get LOADed from cartridge.A Cartridge contains ROM
which actually maps into the computer's address space.So the user himself
actually loads the programme manually when he inserts it.
But SDX DOES load into RAM.Only the extarnal programmes and special SDX library
that provides SDX specific functions stay in ROM.

External commands must first load into RAM to function.

>If you're serious about boosting your A8's performance, keep your

I wish I could find a 130XE.And a atari set-up so that it can run PAL
programmes.I find a lot of those in Yogi's MegaImages.
(HINT:turning off the music and/or sound in a PAL game usually helps)

If the CPU uses 32-bit words,it uses 32-bit words.
I see no confusion.Only the memory is 16-bit.
Oh,and I mean 16-bit data,not address.I have a Amiga and know about the 16MB
limit.

Some (old) IBM mainframes had CPUs that could use a assortment of word sizes.
(really big ones,too!)
I assume that the 68000 can use 8-bit words ("octets") and 16-bit as well.
I remember that the TI-99 was 16-bit.To modify one byte,you had to read in a
16-bit word (the address bus was 15-bit,which could access 64k),modify one
byte,then write out the word.I don't know if this was done by the programme or
internaly by the CPU.(if it's internal,then the TMS9900 also supports 8-bit)
But,then again,the TI-99 is one WEIRD computer.256 bytes of CPU RAM,and 16k of
video RAM.
(which is like the video RAM in the Commodore 128,not in the CPU address space)

SpartaDOS doesn't use the RAM under ANY cartridge.It just uses the OS shadow RAM (RAM that exists at the same location as OS ROM) and RAM right above the OS RAM (database).

>SpartaDOS 1.x does run on the 800, along with the SDX 4.x cart as
>mentioned.
>SpartaDOS 2.x and 3.x do require an XL/XE.

Anoyingly,Atari never made a "Language" cartridge like the one you can use to upgrade Apple][+'s to 64k.

(Apple's cartridges have no cases and are refered to as "cards" and plug into the Apple equivilant of the PBI,of which there are eight)

Tom Hunt Sr. (tomhunt@bright.net) wrote:

: This may be slightly off-topic. But it is along the same lines. There was
: a joystick network once, described in a file at
: ftp://closertohome.dyn.ml.org/ftp/pub/Atari_8bit/New/utility/jnet.arc . It
: has the .m65 source code in the arc file. Here is an excerpt from that doc
: file:

<snip>

Oh yeah, of course joystick port controls aren't out of the question,
but the thing I see here is it's a LOT easier to make a quickly hacked
Game Link II cable than it is to make a joystick cable... and besides,
making a joystick cable means killing either a perfectly good cable
or a joystick, unless you buy and assemble all the parts yourself. :)

What I'd REALLY >LOVE< to see was a simple network protocol that could
work with ANY of the following connectors:

MUX
Game Link II
RS232 (modem)
Joystick port

To the end user (and programmer, especially), the fact that you're using
one thing versus another would be totally transparent. If I wanted to
play "Super Killing Game (TM)" over Game Link II at my house, I'd just
boot up by first running a Game Link II device driver.

If I then wanted to play "Super Killing Game (TM)" with, say, Ben Corr
(closest dedicated Atari user to me that I know of), I could load up
a modem driver and then run the game.

The game wouldn't care, or know the difference.

And more importantly, the person who WROTE the game wouldn't need to
care or know the difference! :)

Does ANYONE agree that this would be a good or cool idea?!

> can show you how to fix it.

And they're not quite right--- the best fix for the 1200XL video is
Ben Poehland's Super Video 2.1 upgrade published in Atari Classics a
few years back. SV 2.1 on a 1200XL supposedly results in the best
video of any 8-bit---specifically, it has deeper color saturation than
an 800 or a SV upgraded 800/600XL or XE.

> >2) I have heard that the 800XL is not 100% backward-compatible and
> >requires the same translator disk that the XE family uses.
>
> Correct, but it's a bit better in compatability than the 1200

In fact, the first step in Bob Woolley's mod to install a parallel bus
in the 1200XL is a mod to install the XL/XE OS and a BASIC ROM
(preferably Rev C)---I've been meaning to do this to my 1200XL as part
of a massive upgrade project for a while. The actual addition of the
PBI looks pretty heinous and not quite worth the effort though, so
I'll probably just stop at the XL/XE OS mod.

> >3) My 1200XL is just cool, is the 800XL better?

> Better??? Ummm...if you need the parallel port it is. minor technical
> factors aside the 1200 is usually perfered for it's very nice
> keyboard.

Also the 1200XL has more room inside for hardware hacks. The power
supply can litterally be cut off the motherboard and replaced with an
external 520ST power supply, I believe, which leaves lots of space for
cool stuff...

> >I am currently using the 800XL (I have two dead 800XLs for parts, one of

Yeah. Just for kicks, I bought a 400 from a thrift shop for $5 last year. I already had an 800 and two 800XLs (wouldn't mind having a 1200XL, those keyboards rock), but I just wanted to try goofing with it for a while.

"A while" became about two minutes, as I grew frustrated *very* quickly with that thing.

But it is good for 16K cartridge games, as good as the 800 or 800XL...

It's great for the hacker because you can easily tweak the hardware
(if you have a clue about electronics), but they keyboard on the 1200XL
is beyond comparison compared to the rest of the 8-bit family.

I used to have one...bought it in '83 as a $199 close-out. I never
had any compatibility problems with it...it even ran M.U.L.E. when the
800XL wouldn't.

I wish I didn't sell it and all the software I had (boo-hoo!) for
$50 several years ago before I caught the bug again...

A L Mazzei (almazzei@aol.com) wrote:
: Instead of joysticks, I've been using Sega Genesis gamepads on my 8-bit
: Atari machines. They seem to work just fine (the center button being
: "Fire") but a friend of mine just told me that when you push any of the
: other buttons on the controller, you can cause a voltage imbalance that
: will slag something on the motherboard.

I hope this is wrong, since I use Genesis gamepads (the 3-button flavor)
all the time! :) (I just bought my second!) I've seen no harm done,
buuuut... I'm dumb. :)

If it is safe, here's a programming tip (I'm supporting genesis controllers
on my new Gem Drop game):

If Paddle(0) == 1 that means a genesis controller's probably hooked
up... if it jumps to 228, that means they pressed
the C fire button

If Paddle(0) == 228 that means either a genesis controller's NOT hooked
up, or they're holding down the C fire button for
some reason

I was going to have Sega controller be an option in this game, but I
figured I may as well autodetect it first, so you don't have to remember
to set it to "Sega" every time. :)

(I also took a cool set of digital photos of a geneis controller and
an Atari controller which I may use in a controller setup screen for this
game.)

Right now, since this game's movement directions are only left and right,
I'm using Up and Down for FIRE (B-FIRE) and C-FIRE.

Lemme hook up my 7800 controllers to see how the second firebutton's
used, if it even can be... (checking......)

Hmmm... nope... looks like, as it's configured now (hardware, I guess),
stock 7800 controllers' second fire buttons can't be used easily on an
XL...

If I'm wrong (I hope), let me know!

THanks!

Yes, I know the 800XL has sharper video, that's what I was saying. It's the compatabilty factor that scares me a bit. I've taken software from 400 to 800 to 1200XL to 800XL and so far have been lucky enough not to experience any trouble, but I've heard that some of the machines run less software than the others. Now, my 130XE has a few compatability differences that I wasn't happy with, but that poor machine blew up last year and is sitting in my closet as well (boy, have I got a pile or what). I may just have to keep all of my machines around and deal with the clutter later...

Hm, sounds like the 1200XL would be better for me if I hacked it up a bit... but then again, the 800XL has alot of that stuff already built-in... Ergh, the plot sickens... well, now I'm thoroughly confused. Thank you for your help, I didn't know my 1200XL was that nifty...

First try the built in self test / keyboard section.
When your extra keys really don't seem to work and only these three, I'd
say it's not a problem of the keyboard, it's a problem of the
GTIA-custom chip, which controls the keyboard ...
It's hard to check, but you have i.e. the following possibilities:
1. You have to open the 130 and take out the keyboard. So you can check
the resitance against other keys - should be the same.

2. If you have an other 130 or 800 XE laying aroung, just swap the
keyboards, to see if there is any difference between them .

After many many years Atari finally ADMITTED to SELLING 15 of these
drives. I used to have one, but none of the Atari service centers
could fix it, for the pure and simple reason Atari never admitted to
making them. They were the equivalent of 4 Atari 810 drives, and they
were priced 4 times the cost of the 810 disk drive.

Let me know if you'd be interested in trading, or else I can only hope
people will want to uprade their XL to a TRUE 16-Bit computer.....

By using the 65C02 core as a part of an VLSI, adding a 2K
scratchpad SRAM and special I/O circuitry, we got all of
the advantages of the 65C816 in a smaller area and greater
speed.

Actually I think Rick needed the articles for a description of the process, not to build the arm.

I, however, am going to build the thing. I bought the Armatron at a Rat Shack last Christmas for $19.95. I just couldn't pass it up. I had wanted to do it way back in the early 80's but never got around to doing it.

As soon as I get set up in the new apartment, I will start the project. As an aside, I went into the local electronics supply house and asked for 12 12-volt solenoids. Their reply was, "What's a solenoid?" :-)

I ended up getting them from Jameco.

!!!DANGER!!!

First off you can buy cheaper from reputable dealers like cdw, necx, or try a www.pricewatch.com search.

The author of this post is Terry Ortman. A 38 year old, single guy, still living with Mom & Dad, who tries to sell lots of "adult material" and other equipment from Mom's house. He was banned by moderators of FidoNet, the Il. State Police have previously served him with a search warrant and siezed all of his equipment. He is now on UseNet where he has started over again. Do a DejaNews search from about 6/96 where he explains "how business works" which was why he took Kubo Akira's (cjms@vnet.com) money but wasn't going to send him a refund or the $268 of equipment he purchased. Kubo complained openly on UseNet about not getting delivery after months. Terry "fined" him $250,000 and applied the money from his order to the fine! No joke. He is one strange boy. It seems he collects your money, THEN goes out and tries to buy the unit he sold you. If there is a problem, it was the "supplier" who ripped you off" not him.

I personally would be very concerned about encouraging this sort of person by supporting his "products" (assuming you ever get what you paid for).

For additional information try:
*DejaNews (around 6/96)
*e-mail the listserver at scammers@pdsig.com
*http://www.dynweb.com/theblacklist

This has been a public service announcement.

1422. Atari 8-bit catalogues reminder

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-21 00:00:00 UTC
From: DGS <dgs@clara.net>
Message-ID: <5thukr$o46$1@eros.clara.net>
Source record: 70642

Just wanted to remind everyone (again!) that our Atari 8-bit product catalogues are now
available on-line from our WWW homepage.

Thanks to all 165 people who have visited our page since 01/Aug/97. However, nobody seems to be ordering anything!

In case you don't know, we sell PD and Commercial software for the Atari 8-bit, along with a variety of used hardware, software and magazines.

We have English language distribution rights to all Power Per Post products, including the QUICK programming language and Screen Aided Management 80 col. desktop system.

Our 80K catalogue lists all 190 PD disks and details all our Commercial software.

The list of used items is also available on the WWW site.

The catalogues are available as individual text files, or as a combined .ZIP file for easier downloading.

Demos of QUICK and Digi-Studio are also available for download from the WWW site.

We can ship to any country, and can accept payment in US$. See the catalogues for full details.

If you haven't visited our WWW page then please have a look now! We might have something you want!!

WWW: home.clara.net/dgs

Keep the 1200Xl.. it is a rare Atari 8bit gem. Granted it is not 100%
compatiblity with the original Atari 8bits.. but I would wager it is about
90-95% compatible with all Atari stuff..

Interesting. But on the subject of the 815 drive, I vaguely recall that a local store had one of them on the service bench many years ago. When I asked about it, they said that some guy dropped it off for repairs (which they couldn't do -- no schematics available) and never picked it up.

The store is long since gone. I couldn't say what happened to the drive. Good thing SOMEBODY (probably not Terry) has one.

What's more in that box <grin>?
It can be that easy, there are cables out there who have hardware
build in to hoop up a Centronic printer to your XL/XE.
But before buying an expensive inkjet, why not try it out with
a simple matrix printer first. If it doesn't work, no much harm...

Bo.

ps, you could try and find a real Atari printer in that hardware box :D

Ra> is there a way to transfer files from my atari800xl to pc by null
Ra> modem connect?
Ra> if so how would i go about doing so?

Hi,

well, you could transfer files from your fantastic XL to
that dummy Pc <grin> is using a SIO2PC interface.
You should be able to find this package on a FTP side somewhere.
If not, let me know, and I will email it to you.
In the package is a description on how to make the interface.

If you want to use a null modem, you'll need a modem on your Atari.
A SX212 modem can be picked up fairly cheap I guess.
Then using a null modem and Ice-Term or other terminal program
you should be able to transfer files.

Although the Sio2pc interface is a better alternative.
Using this interface you can set up your PC to be a mass storage device
for your XL (i.e. you can access it as drive D1: or D2:, etc.).

I don't know what that cable is, but you can be pretty sure that if it's going to work, there must be electronics built into the Centronics connector.

Ink jets normally don't come with a manual full of codes. But if you contact the manufacturer (who probably has a web site) you might be able to get them. My H-P 660C's codes came down as a text file that's longer than I would have imagined. But then again, color and a lot of other fancy things are involved.

I never did write the drivers I'd need to let the Atari make full use of the printer, but it's on my list for someday ...

Don't worry...Sega gamepads work pefectly on 8-bit Atari's, it's your
friend who doesn't know much. The only voltage readings would be for the
paddles, and yes I did tried them out.

The only machine that I know that has trouble with them is the ST's
because of the 5V signal, but then as far as joystick ports go the ST
isn't too brilliant on them.

Right now I'm using a SMS control for my 8-bit and 2600 games so go for it
man :)

1431. Put all your public domain software on a CD: the POOLDISK II

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-21 00:00:00 UTC
From: ernest@pi.net
Message-ID: <33fcc89c.4656163@news.pi.net>
Source record: 70651

It has been two years since we produced the POOLDISK, a CD that
contains about 2300 public domain / shareware / freeware diskettes
for the XL/XE in ATR format. We are currently working on a new
version, the POOLDISK II. This CD will contain even more diskettes.
We gained acces to a stack of diskettes with Dutch software, and
we are sure that there are lots of other disks out there that we do
not have in our private collection. So we need your HELP!!!!

Actually, you can do yourself a favor. If you happen to have any
disks that we do not already have, it would be greatly appreciated if
you would send us or E-mail us a copy of it in the ATR format. A
regular copy of an 8-bit disk is fine too of course. We will then put
that disk on the next POOLDISK. Then, if you obtain a POOLDISK
from us, it will contain all the public domain / shareware / freeware
diskettes that you own. This will provide you with an excellent
backup of all your disks, and in the mean time, you can share all this
software with all other classic Atari users. So, this is sort of like
having all your disks written to a CD for free! Well, you have to pay
us for the cost of the CD of course, but, since we sold a lot of
copies of our first POOLDISK, we have recovered all our cost
(investment in hardware, software, photographs etc.) so we can produce
this next POOLDISK real cheap. Our original POOLDISK was sold
at US $ 35, but we can produce the second POOLDISK much
cheaper. We have not yet set a fixed price, but the POOLDISK II
will be sold at half that price or less! Note that this price is not
fixed yet, as we are still considering the option to make it a
double-CD. But rest assured that this CD will be real cheap.
We would like to take this opportunity to thank everyone who has
purchased our first POOLDISK, for through their support, we can
create this second POOLDISK at these astonishing prices.

So, send us ALL the PD / shareware / freeware that you have,
If you want to verify whether or not we already have the program
or disk you want to send to us, feel free to ask, just send us a note.
If you are a librarian, or know one, contact us! We can create a
separate directory on the CD to identify that these disks come
from your usergroup. This is THE chance to create a permanent
backup copy of your library.

If you have photos of rare 8-bit items or other material that would
be interesting to put on this CD, contact us! Any other suggestions
are welcome too! Any rare 2600 stuff is equally welcome!

Make sure you do not miss this opportunity to participate in this
project. Don't disappoint us, make my mailbox full with ATR's.

The more people participate, the faster we can produce this CD. We are planning on releasing it before the end of this year, maybe even in time for Christmas. So help us please!

Whilst reading the rubbish I usually find here, Steven Posey wrote something interesting about Re: Atari in music?,

Hello Steven,

>Anybody know how it is used in the game?

I'm only a novice Go player, having played a couple of times. I knew that Atari got the name from Go. I don't know enough about the game yet. :-(

The _other_ S.A.M., produced by Power Per Post (PPP) of Germany. :)

Here's more than you wanted to know, from the Dean Garraghty Software
catalog at http://home.clara.net/dgs/

S.A.M. COMPLETE PACKAGE:
========================

Screen Aided Management (SAM) is a new 80 column desktop environment for
the Atari XL/XE. SAM is very much like some other systems of this type
found on computers like the ST, and IBM PC.

SAM is based around a main environment, where you have standard DOS
functions (such as DIRECTORY, FORMAT, DELETE, etc.), but also contains
some special utilities. The SAM system can be controlled by using a
joystick, or (even better) an ST compatible mouse!

SAM is supplied with monochrome and colour character set editors, a card
filing system, a monitor (for looking into memory), an 80 column word
processor, a 128-colour paint program, and (for the international version

only) a game called FireBall which runs under SAM. Although SAM uses 80
columns, it does not need any extra hardware to do this! The SAM system
is
extendable by special accessories which are also available (see below).

SAM is supplied on a SS/SD disk which contains everything mentioned,
along
with a 26 page manual, which also explains how to use SAM routines in
your
own programs.

SAM BUDGET is an accessory disk for use with the SAM 80 column desktop
system. Budget is a spreadsheet program having many excellent features
found on more expensive systems. Budget takes full advantage of SAM's 80

column display, and mouse and joystick input. Features include Direct Calculations, Indirect Calculations, and Functions (single or multiple parameters). Budget also has advanced editing facilities, including column
and row copying and deletion, and easy movement around your spreadsheet. Budget is able to print to both Epson compatible and 1029 printers. Budget
is supplied with a comprehensive jargon-free manual, which is helpful for

those who haven't used a spreadsheet before.

SAM UTILITY EXTENSIONS 1 is another accessory disk for use with the SAM 80
column desktop system. This disk actually contains two accessories: SAM Convert and SAM Creator. Convert will convert text files to and from the SAM Texter format. Convert will convert from ASCII, AtariWriter, StarText,
and AustroText to SAM, and from SAM to ASCII. Creator will convert SAM Painter format files to Micro Painter format and vice versa. These two accessories an extremely useful tool for SAM Texter and Painter users. Supplied with a user manual.

SAM DESIGNER is a powerful drawing and design package for creating mode 8

high resolution graphics. As well as all drawing features, Designer can import text from SAM Texter (which comes with SAM), and has a set of schematic icons for creating circuits. These icons can be easily edited using the SAM character editor (which comes with SAM) to whatever icons you
want. All options are icon operated, and the package works with both joystick and ST mouse. Screens can be printed on Epson and 1029 printers.

You can write drivers for other printers using the instructions given in the
manual. The package comes with an easy-to-follow manual.

The COMPLETE S.A.M package including the main system, Budget, Utils 1, AND
Designer now costs just #14.99 INCLUDING P&P.

```
< Radio-Shack adapter >
Don't think this will work, cause i _think_ it isn't AC-power output, but
DC-power output.

An ATARI 1050 needs AC-power, 9 Volts, 27VA (or 27W). The 27VA may also
be a little more since this is the maximum the power-supply CAN give. The
diskdrive just _asks_ as much it needs...

Remark: 27VA is what mines says, but i know there are some different
versions of 1050 power-supplies.

< Searching for... >
Let me know if you've found some :-) I've been looking for a packet-radio program since the last2 years and still haven't found even only one.
There is another sollution to communicate with the packet-radio-world with the use of an ATARI XL/XE, but you need an expensive packet-radio-modem in that case (not a bay-com look-a-like).

These modems can be connected to any COM-port and will communicate with an ordinary terminal-program...
you only can use one channel ofcourse and you don't have any of the special packet-radio-features in such a terminal, but maybe with the use of macro's you can ?

Oh, you also need a PC-compatible comport, like an ATARI 850, P:R:, MI/O , Black-Box, etc... Maybe even a 'joystick-RS232' will work...

```
< 800XL <=> PC >
You can use A.P.E. and choose for the PC-MIRROR option to transfer files
FROM PC to XL. I think the registered version can even do the reverse...

If you have an ATARI-diskdrive that's able to use true-double-density you
can use ATARIDSK on PC to read and write 5.25" disks on a PC using the
PC-5.25" mechanic (if you have one of-course).

To be save, use My-Dos to format the ATARI disk before writing any data on
it.
The format-option of ATARIDSK will not work properly (in my case).

Sysop FOX-1

1440. Sega Genesis Gamepads on Atari

Newsgroup: comp.sys.atari.8bit
Date: 1997-08-21 00:00:00 UTC
From: almazzei@aol.com
Message-ID: <19970821030500.XAA05452@ladder02.news.aol.com>
Source record: 70660

Instead of joysticks, I've been using Sega Genesis gamepads on my 8-bit Atari machines. They seem to work just fine (the center button being "Fire") but a friend of mine just told me that when you push any of the other buttons on the controller, you can cause a voltage imbalance that will slag something on the motherboard. Is this true, or is he just PO'd because he never thought to do it? I know people who use the gamepads on their C64s with no trouble (and you KNOW how flakey the power on those things are...(my 1st computer was a C64)). Anyway, I love my Ataris and know relatively little about them, so please pardon my ignorance.
Vive Analogue!

The Atari uses the 6502C, not the 65C02, which was a hybrid technology
that added more bugs tot eh processor....

I prefer the 65C816 myself, since it runs faster and proccess
information faster, speeds up the 8-bit to around 350% faster.
